Transfer learning and Domain adaptation

Vision & Language

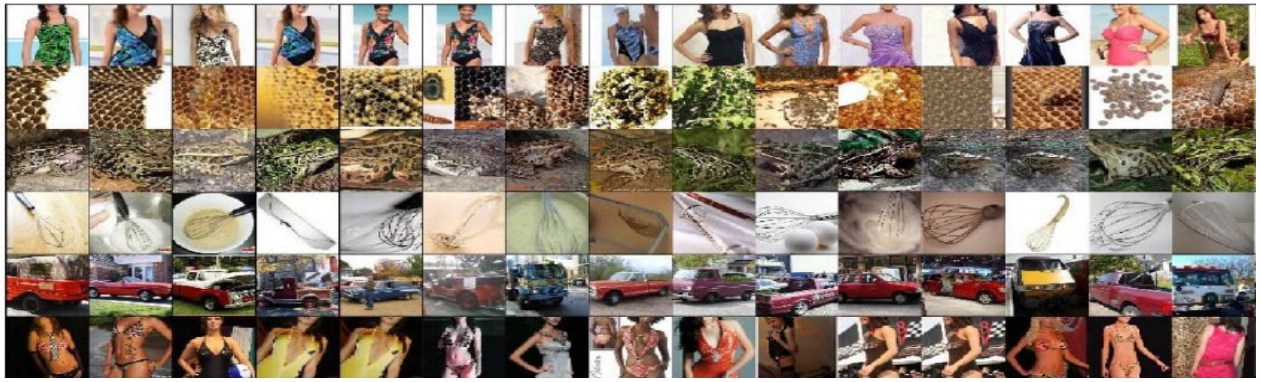
Transfer from ImageNet (source)

Transfer as **generic features**

Brut Deep features (learned from ImageNet)

(== a learned embedding from Image to vector representation)

Retrieval



Transfer learning (from source to target)

Frozen features + SVM => solution to small datasets

Frozen features + Deep

Fine tuning not easy in that case (small datasets)

Transfer from source(=ImageNet task) to target task

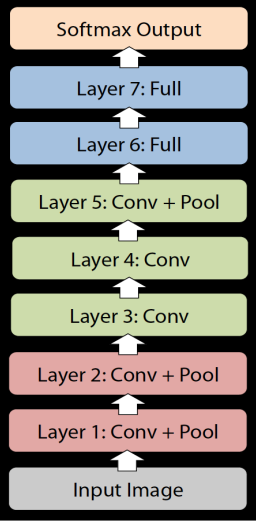
Source: ImageNet (dataset + 100 classes) => AlexNet trained

Target: new dataset Cal-101 and new classification task with 101 classes =>Chopped

AlexNet (layer i) + SVM trained on

Architecture of Krizhevsky et al.

- 8 layers total
- Trained on Imagenet dataset [Deng et al. CVPR'09]
- 18.2% top-5 error
- Our reimplementation: 18.1% top-5 error



Tapping off Features at each Layer

Plug features from each layer into linear SVM or soft-max

	Cal-101 (30/class)	Cal-256 (60/class)
SVM (1)	44.8 ± 0.7	24.6 ± 0.4
SVM (2)	66.2 ± 0.5	39.6 ± 0.3
SVM (3)	72.3 ± 0.4	46.0 ± 0.3
SVM (4)	76.6 ± 0.4	51.3 ± 0.1
SVM (5)	$\mathbf{86.2 \pm 0.8}$	65.6 ± 0.3
SVM (7)	$\mathbf{85.5 \pm 0.4}$	$\mathbf{71.7 \pm 0.2}$
Softmax (5)	82.9 ± 0.4	65.7 ± 0.5
Softmax (7)	$\mathbf{85.4 \pm 0.4}$	$\mathbf{72.6 \pm 0.1}$

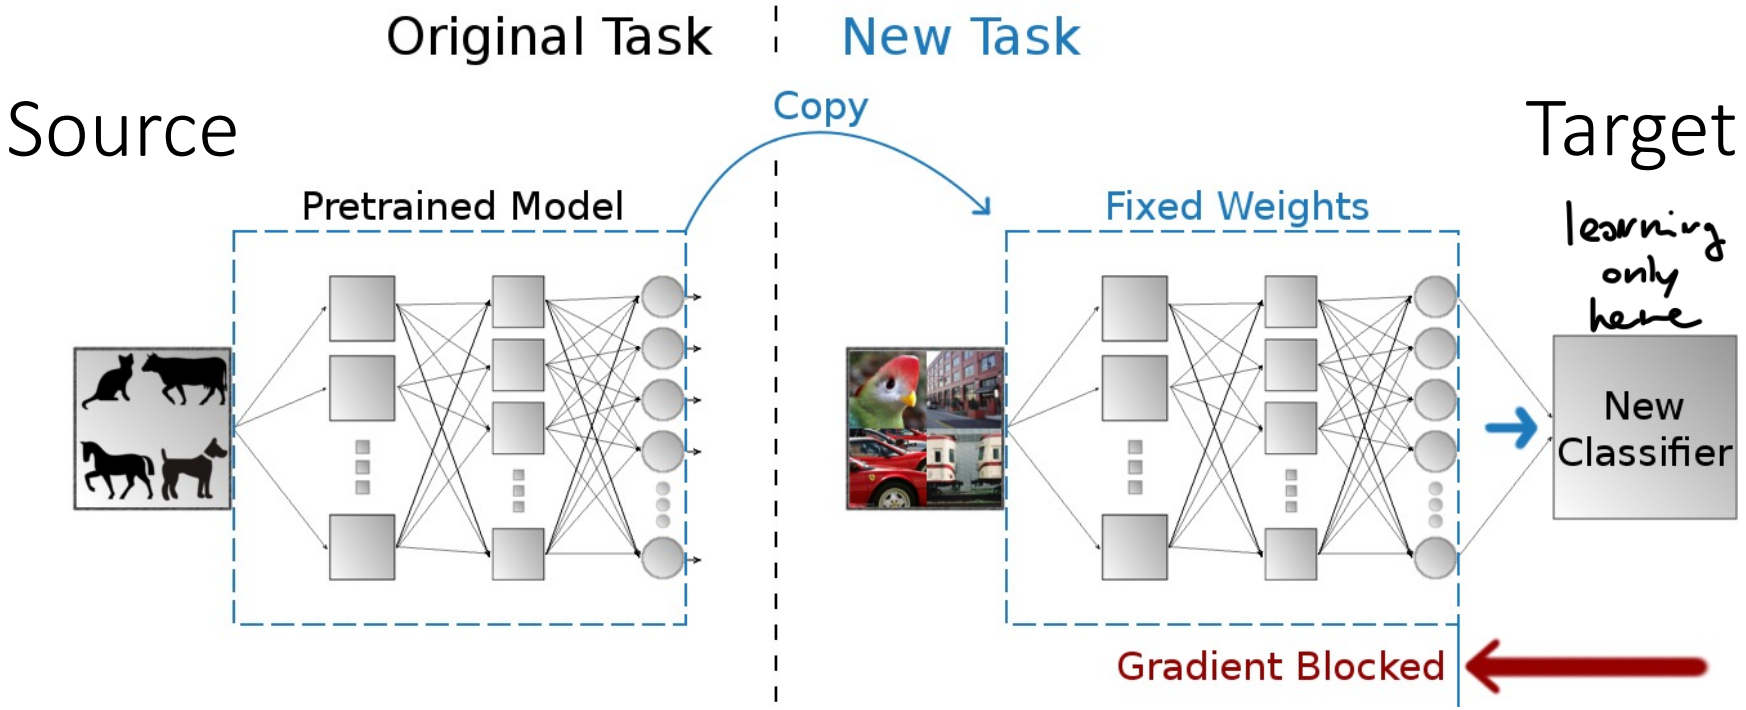
=> Results better than SoA CV methods on Cal-101!

Transfer: fine-tuning of a deep model on target task

Train a deep (AlexNet) on source (ImageNet)
Keep the deep params. for target and complete with a small deep on top (fully trained on target task)
Fine-tune the whole model on target data

Challenge: only limited target data, careful about overfitting

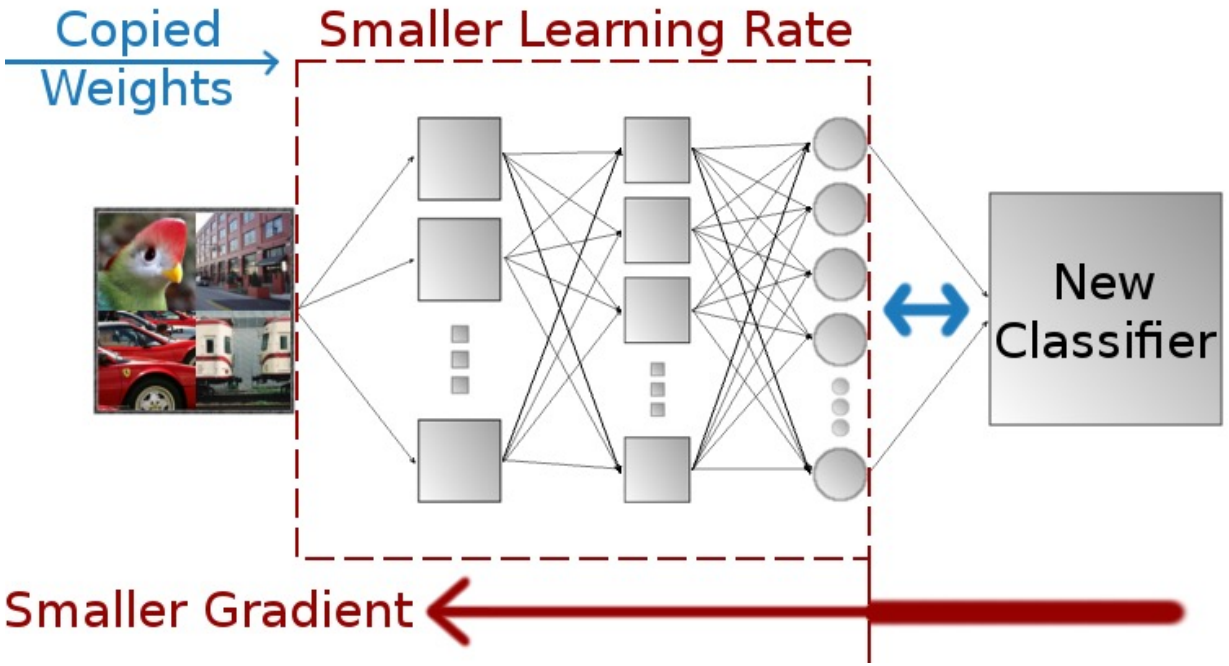
Solution: Freeze the gradient's update for AlexNet part



Transfer: fine-tuning of a deep model on target task

Train a deep (AlexNet) on source (ImageNet)
Keep the deep params. for target and complete with a small deep on top (fully trained on target task)
Fine-tune the whole model on target data

- Challenge: only limited target data, careful about overfitting
- Solution: Freeze the gradient's update for AlexNet part
- Other solution: use smaller gradient's update for AlexNet part

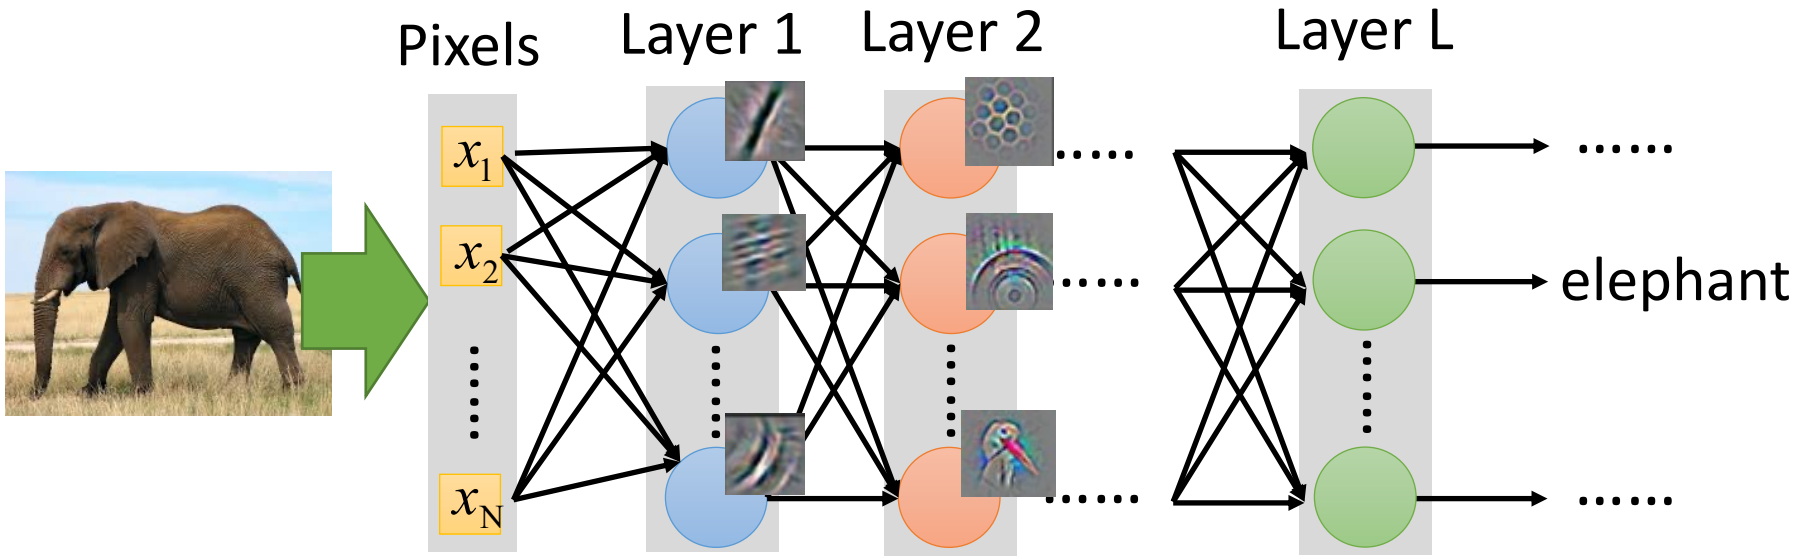


Transfer: which parts of the deep?

Skip

Which layer(s) can be transferred (copied)?

- Speech: usually copy the last few layers
- Image: usually copy the first few layers



Transfer: which supervision?

- Task description
  - Source data: (x^s, y^s) ⟸ A large amount
  - Target data: (x^t, y^t) ⟸ *(Very)* little

Rq: Few/One-shot learning: only a few/one examples in target domain

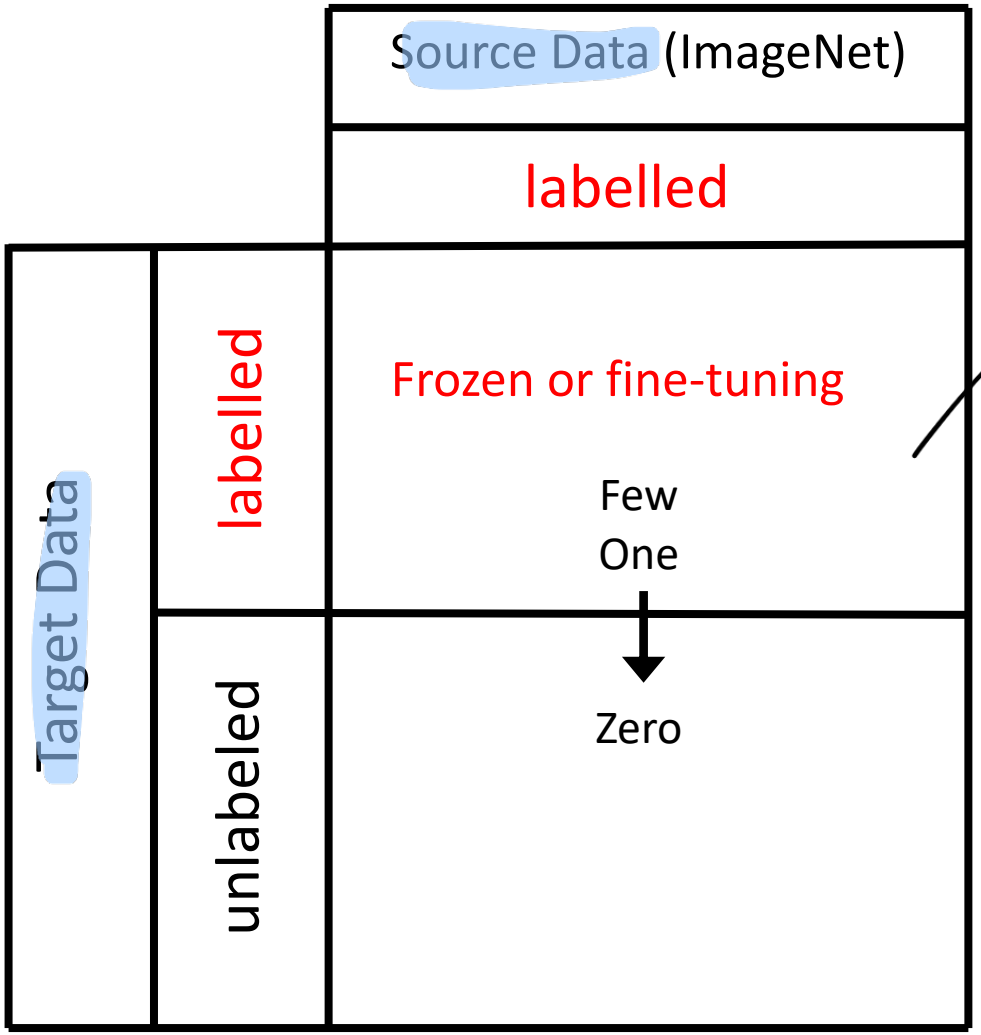
Many different contexts:

In vision: from large dataset (ImageNet) to small datasets (VOC2007)

In speech: (supervised) speaker adaption

- Source data: audio data and transcriptions from many speakers
- Target data: audio data and its transcriptions of specific user

More on transfer framework



a very few labelled data

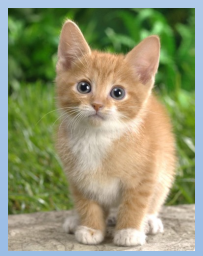
Main purposes:
Similar visual domain?
Same tasks (ie class)?

Source ≈ Target similar → easy
Source ≠ Target → hard

source = medical
target = driving

Similar domain: ImageNet task => Dog/Cat task

Target:
Dog/Cat
Classifier



cat

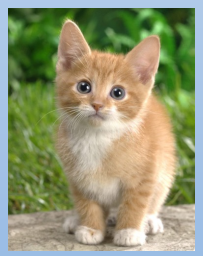
dog

Data ***not directly related to*** the task considered

ImageNet: Similar domain,
different task (1000 classes but NOT Dog and Cat classes)

General Framework for Transfer Learning

Target:
Dog/Cat
Classifier



cat

dog

Data ***not directly related to*** the task considered

elephant

tiger

Similar domain, completely different tasks

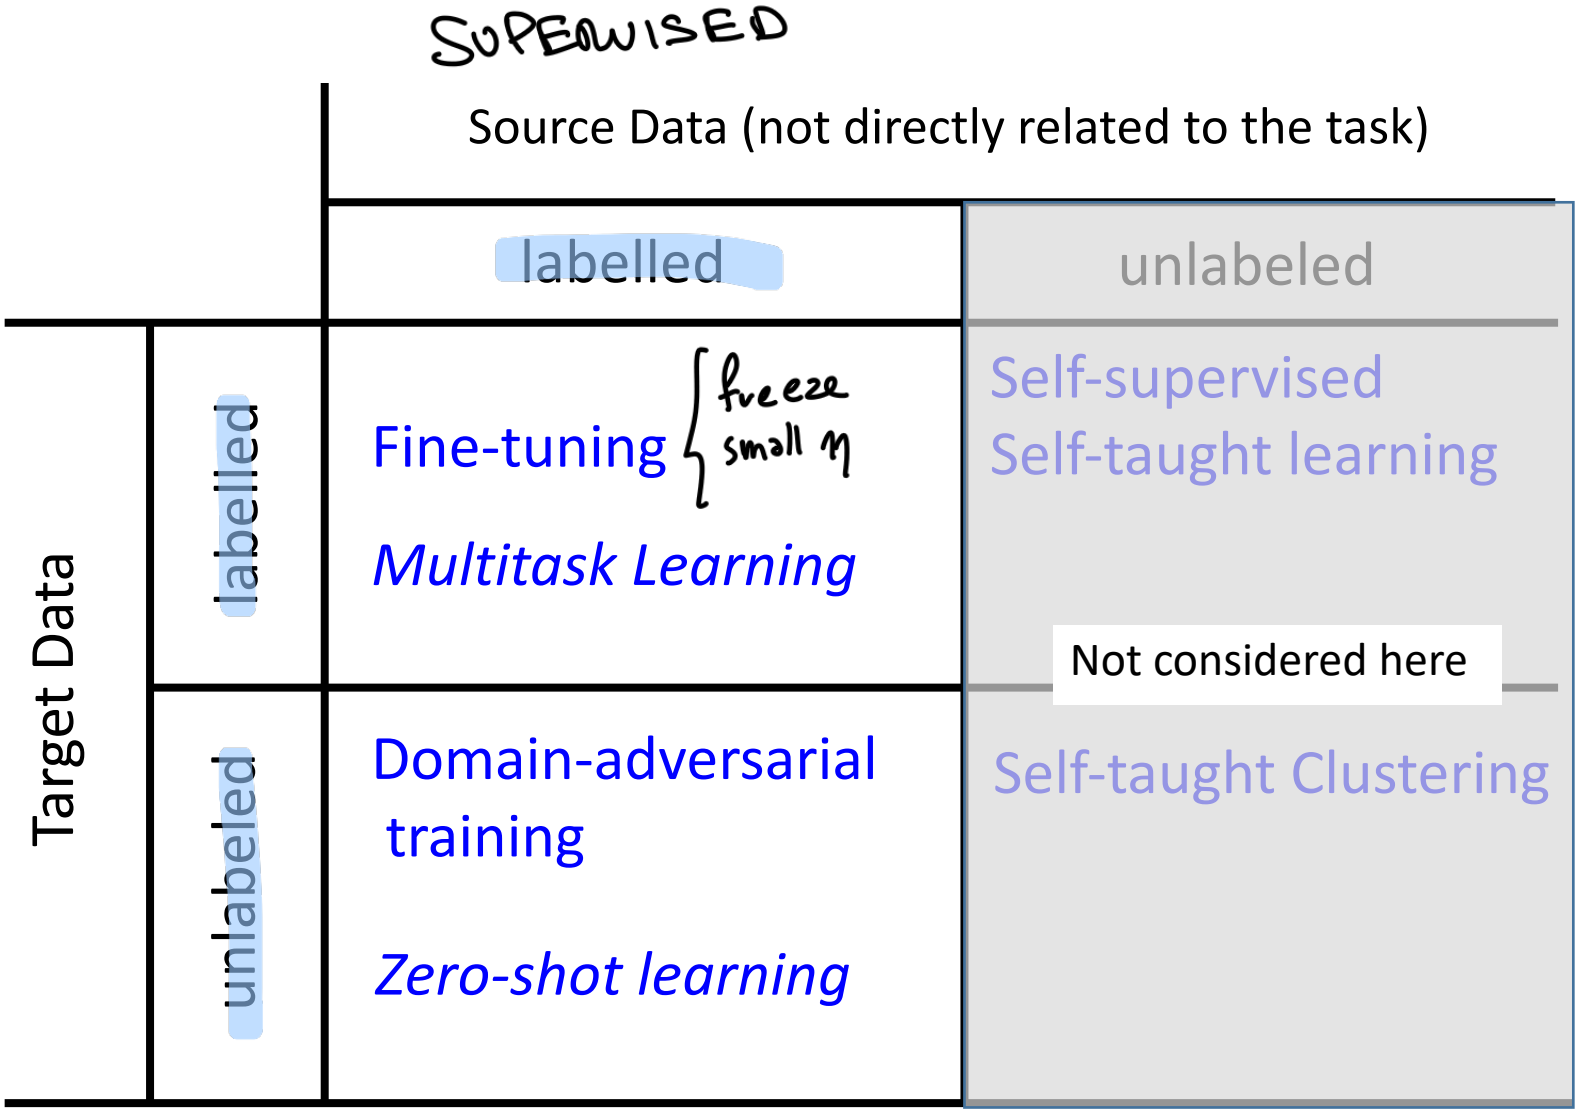
dog

cat

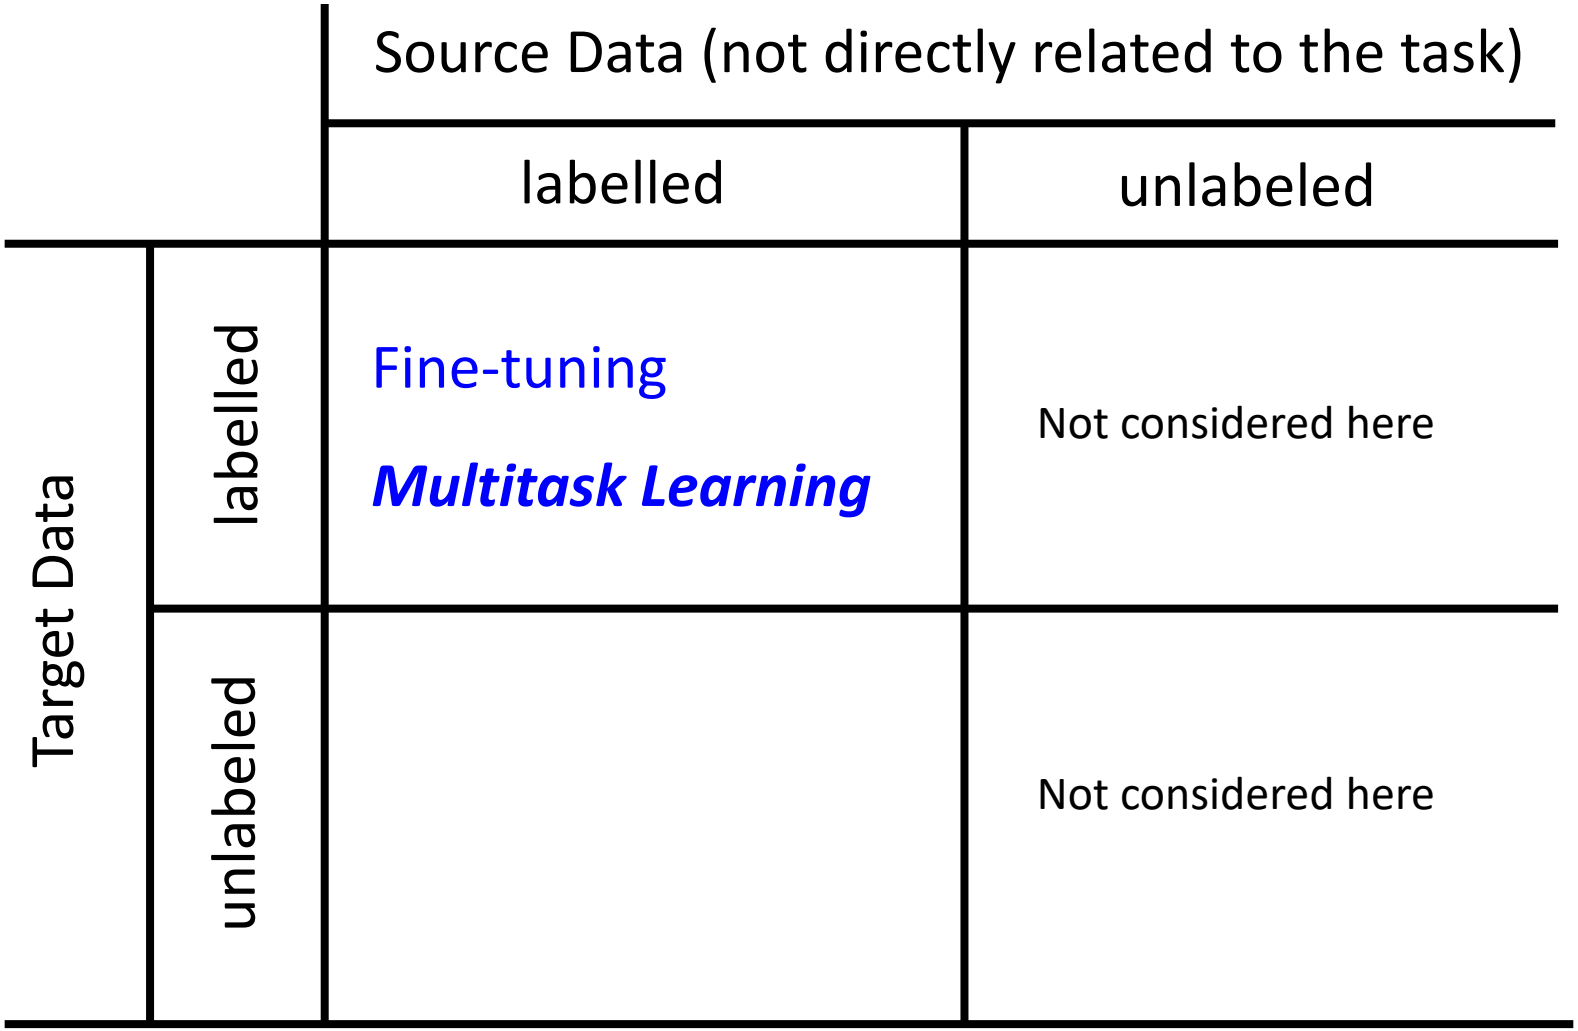
Different domains, same task

big problem

General Framework for Transfer Learning

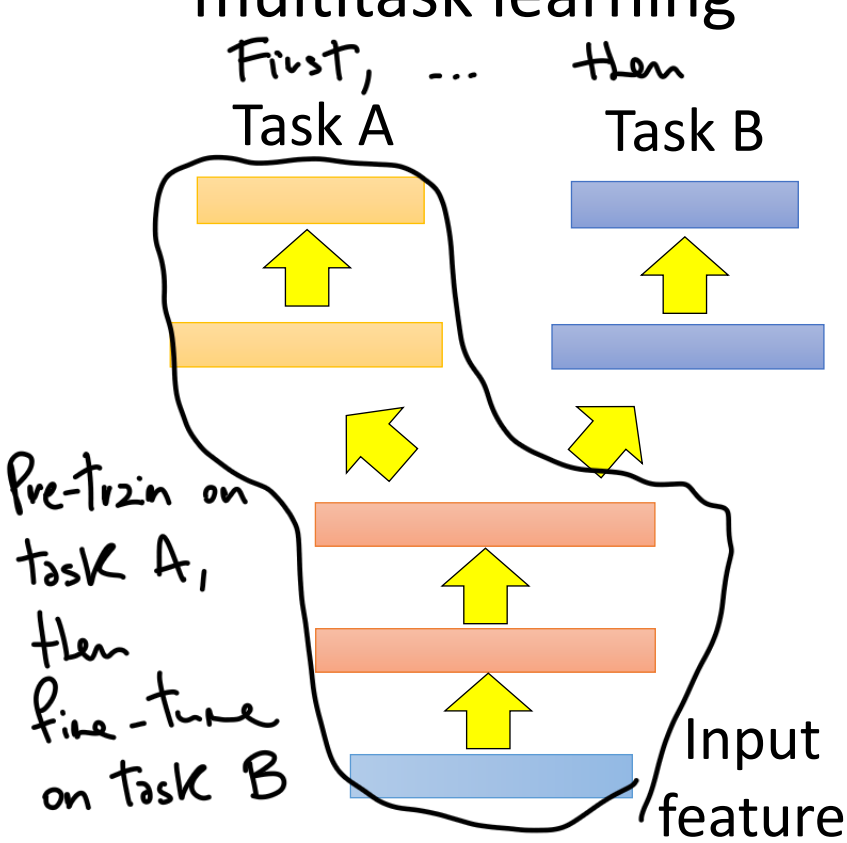


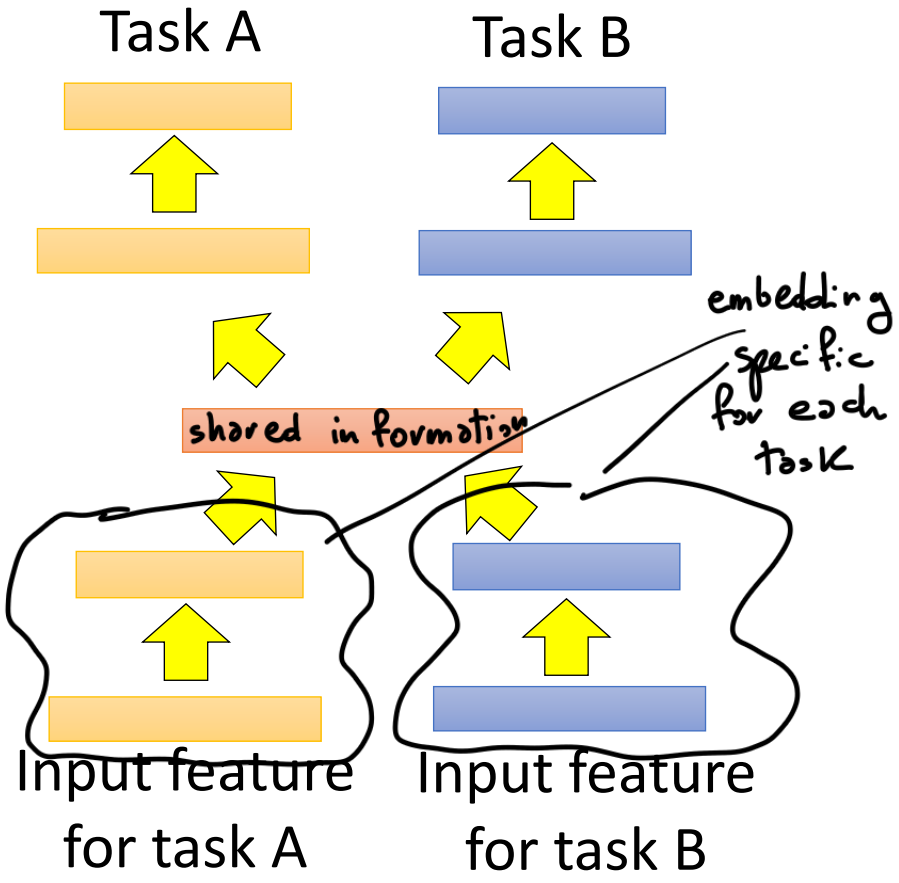
General Framework for Transfer Learning



Multitask Learning

- The multi-layer structure makes NN suitable for multitask learning





Transfer Learning - Overview

Target Data		Source Data (not directly related to the task): labelled	Source Data (not directly related to the task): unlabeled
	labelled	Fine-tuning (together, but sequentially) *Multitask Learning* (parallel, different encoders)	Not considered here
	unlabeled	**Domain adaptation-adversarial training**	Not considered here

Unsupervised Domain Adaptation (UDA)

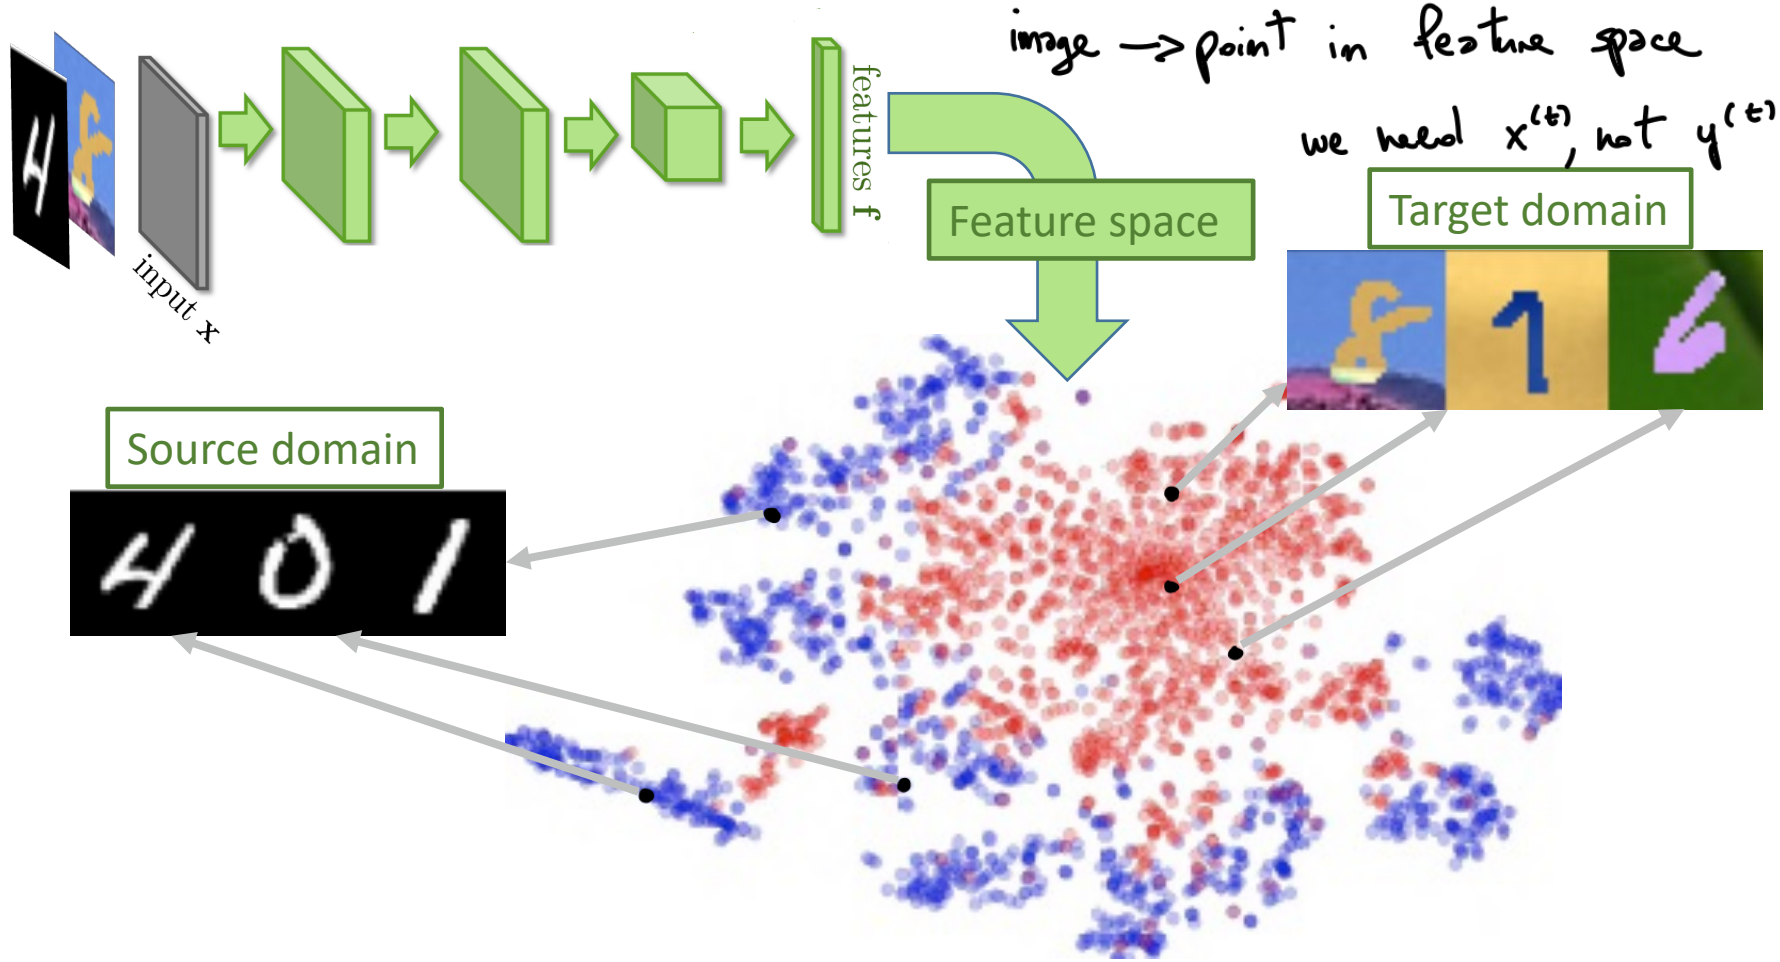
Source data: (x^s, y^s) (supervised) → Training data

Target data: (x^t) (unsupervised) → Training data

Same task, domain mismatch

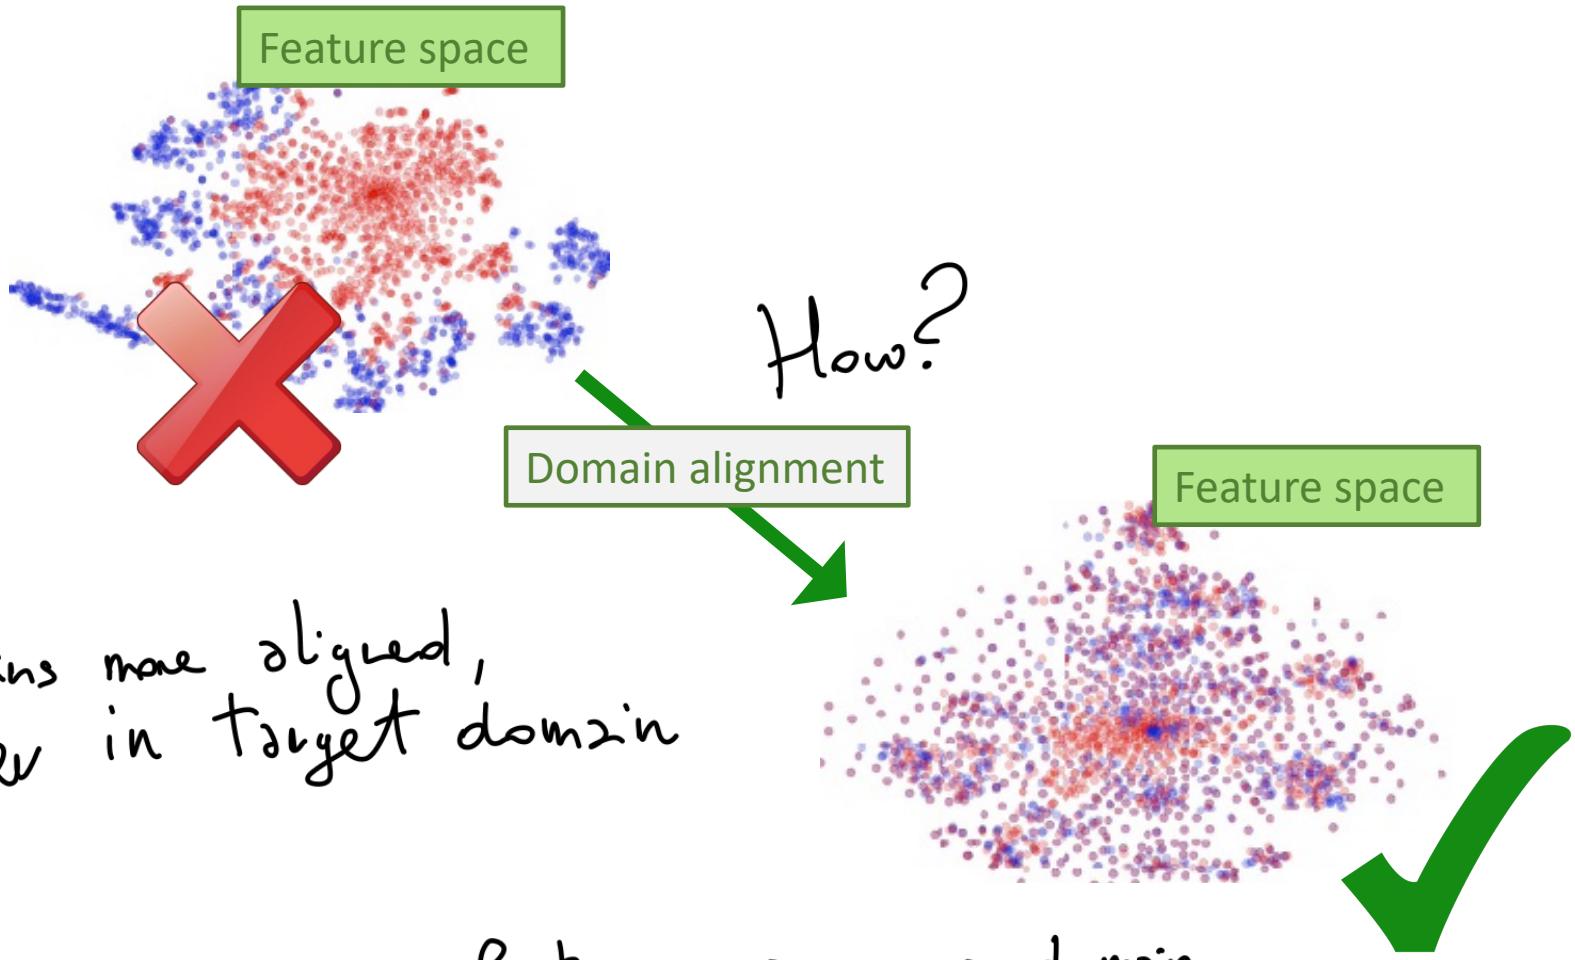
Final test on target domain! (but same task 0..9)

Unsupervised Domain adaptation (UDA): objectives



Main principle: diminish the domain shift in the learned features, encourage domain confusion

UDA strategy: align both domains



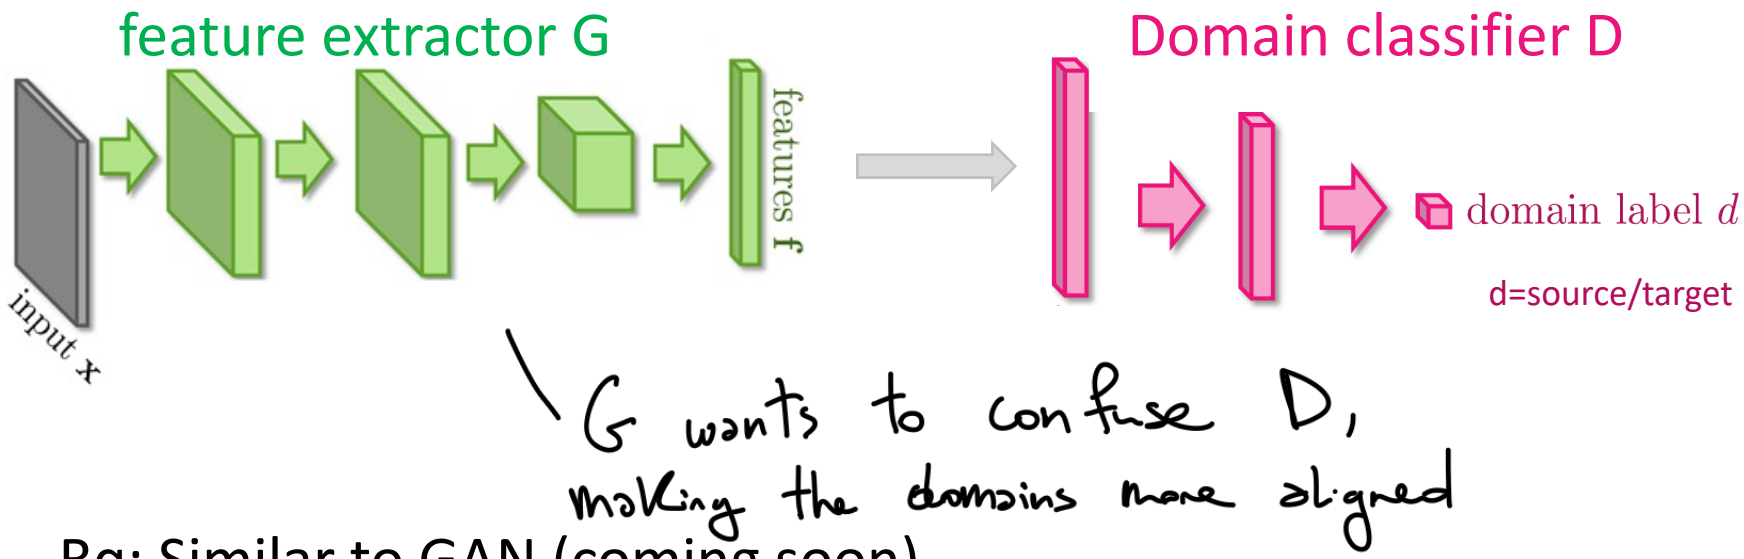
UDA strategy: 1/ domain-adversarial training

Add to the feature generator (G) a domain classifier (discriminant D) for which labels are available!

Learn G and D:

G tries to align domains

D tries to identify domains

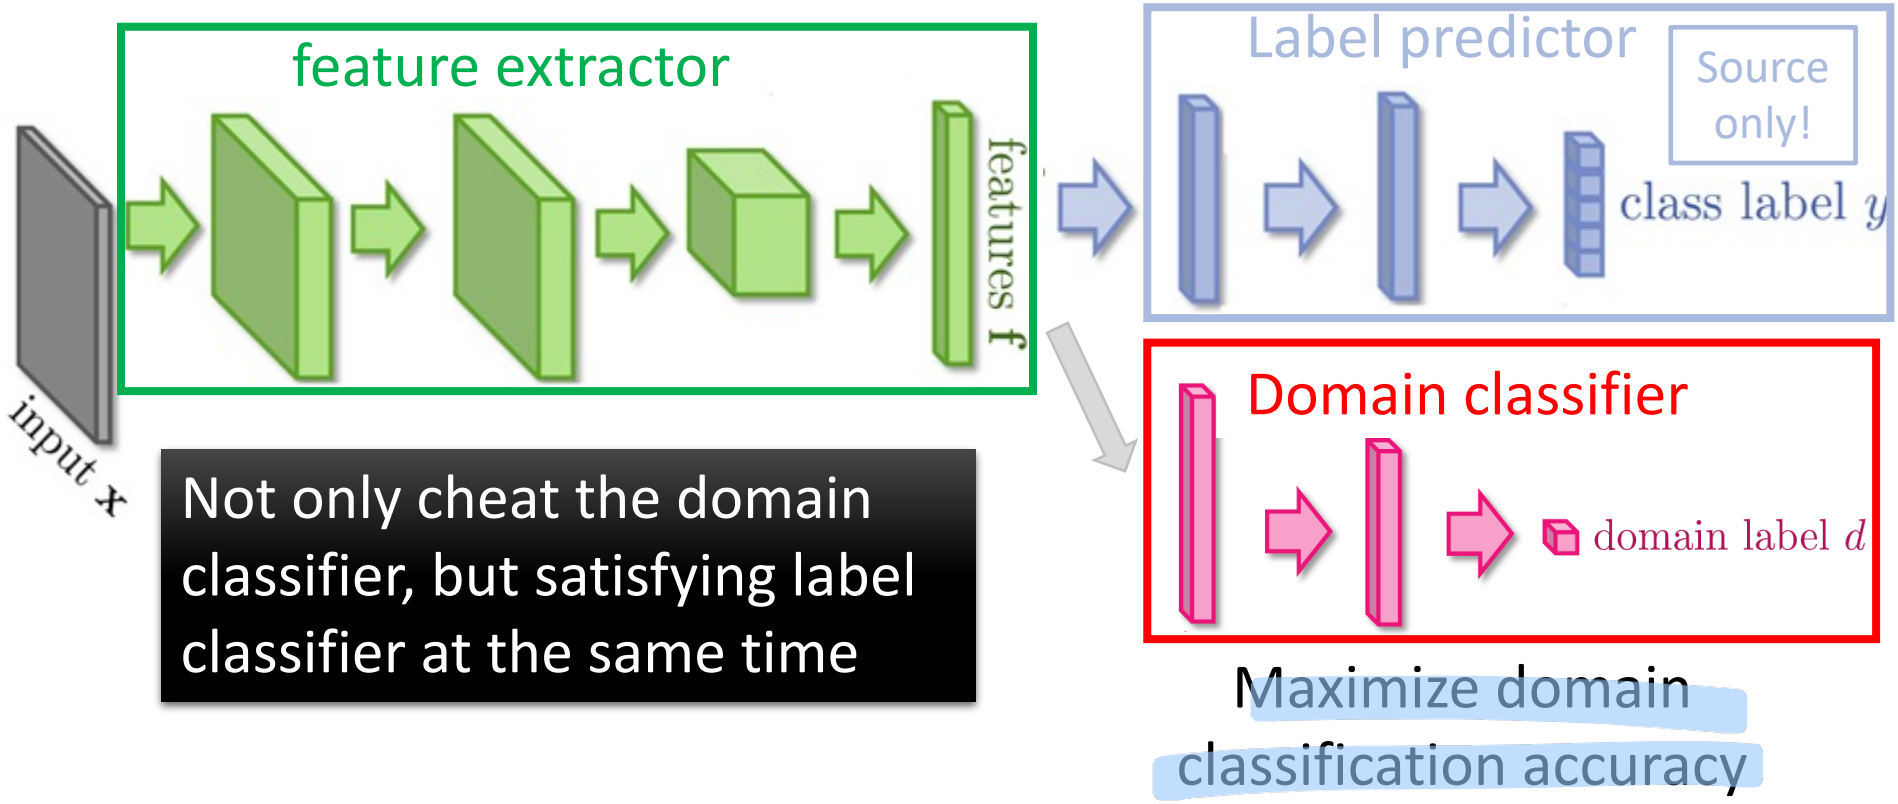


Rq: Similar to GAN (coming soon)

UDA strategy: 1/ domain-adversarial training
2/ classification task (same for source and target here)

Maximize label classification accuracy + minimize domain classification accuracy

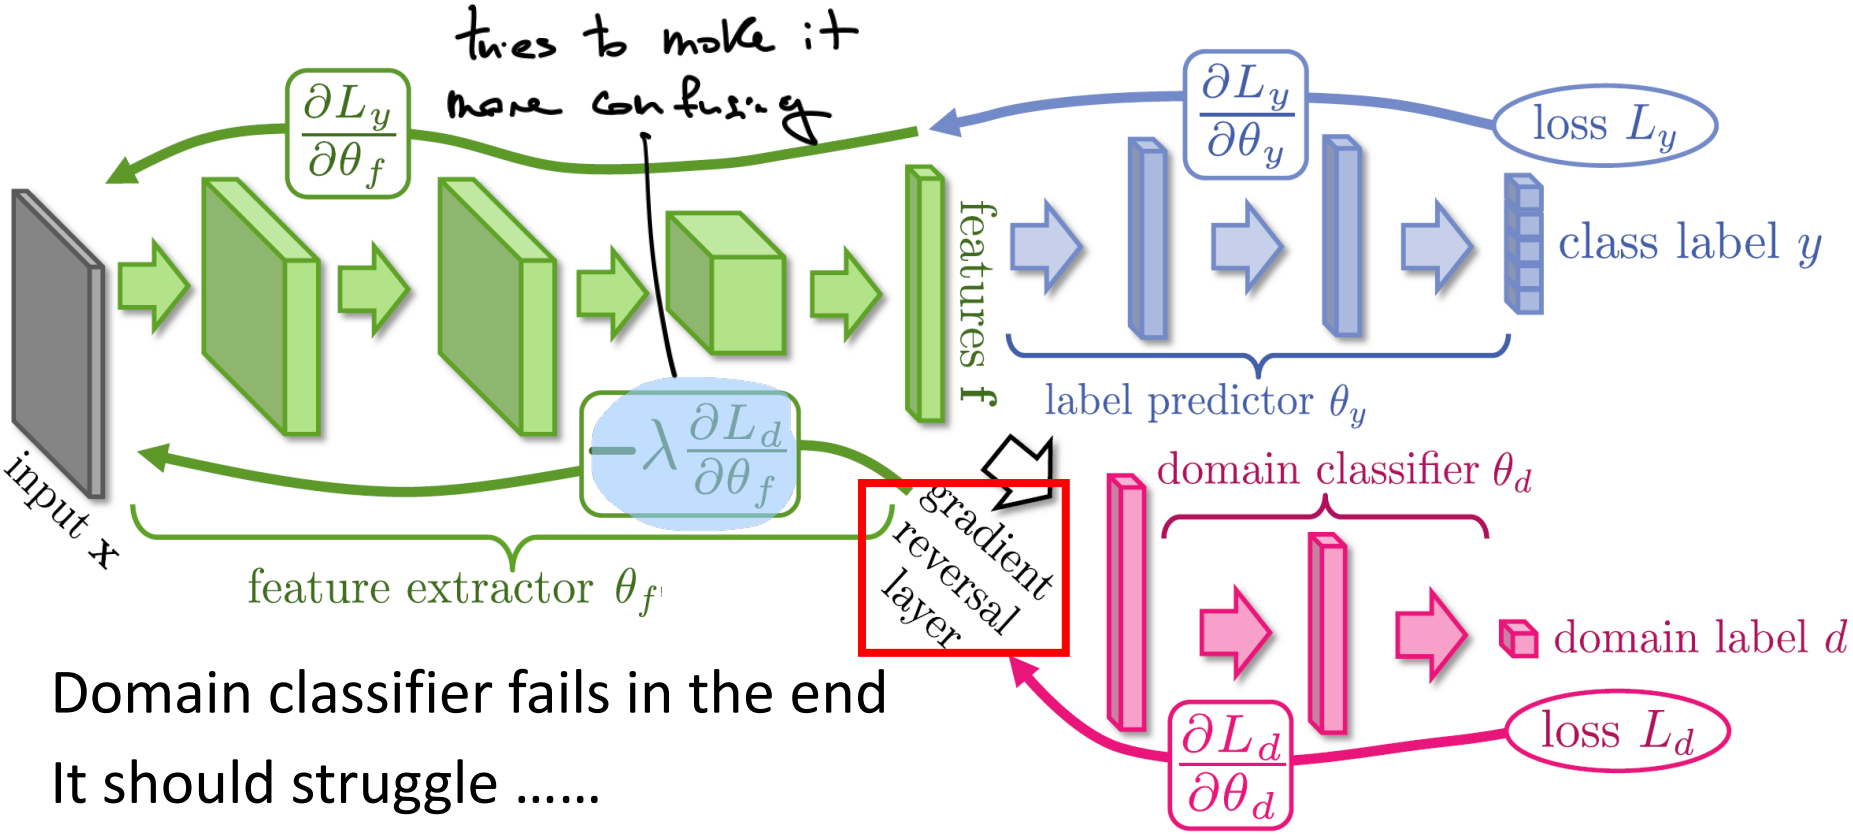
Maximize label classification accuracy



Not only cheat the domain classifier, but satisfying label classifier at the same time

Maximize domain classification accuracy

UDA strategy: joint learning



Domain classifier fails in the end

It should struggle ……

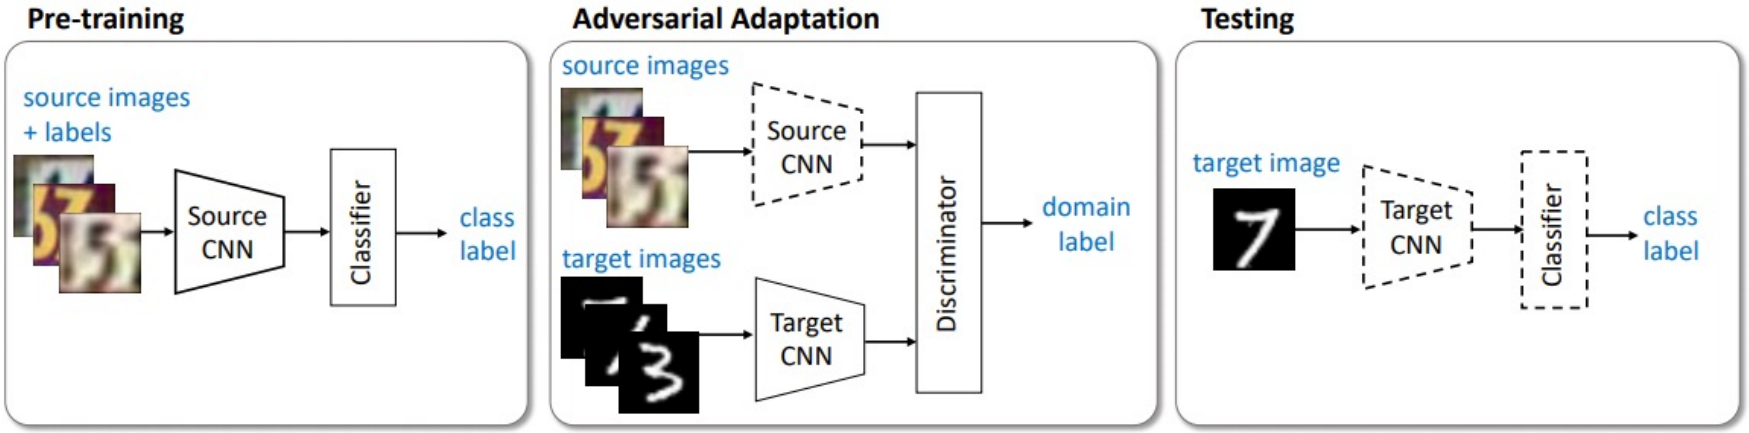
Domain adaptation

skip

Main principle: diminish the domain shift in the learned features, encourage domain confusion

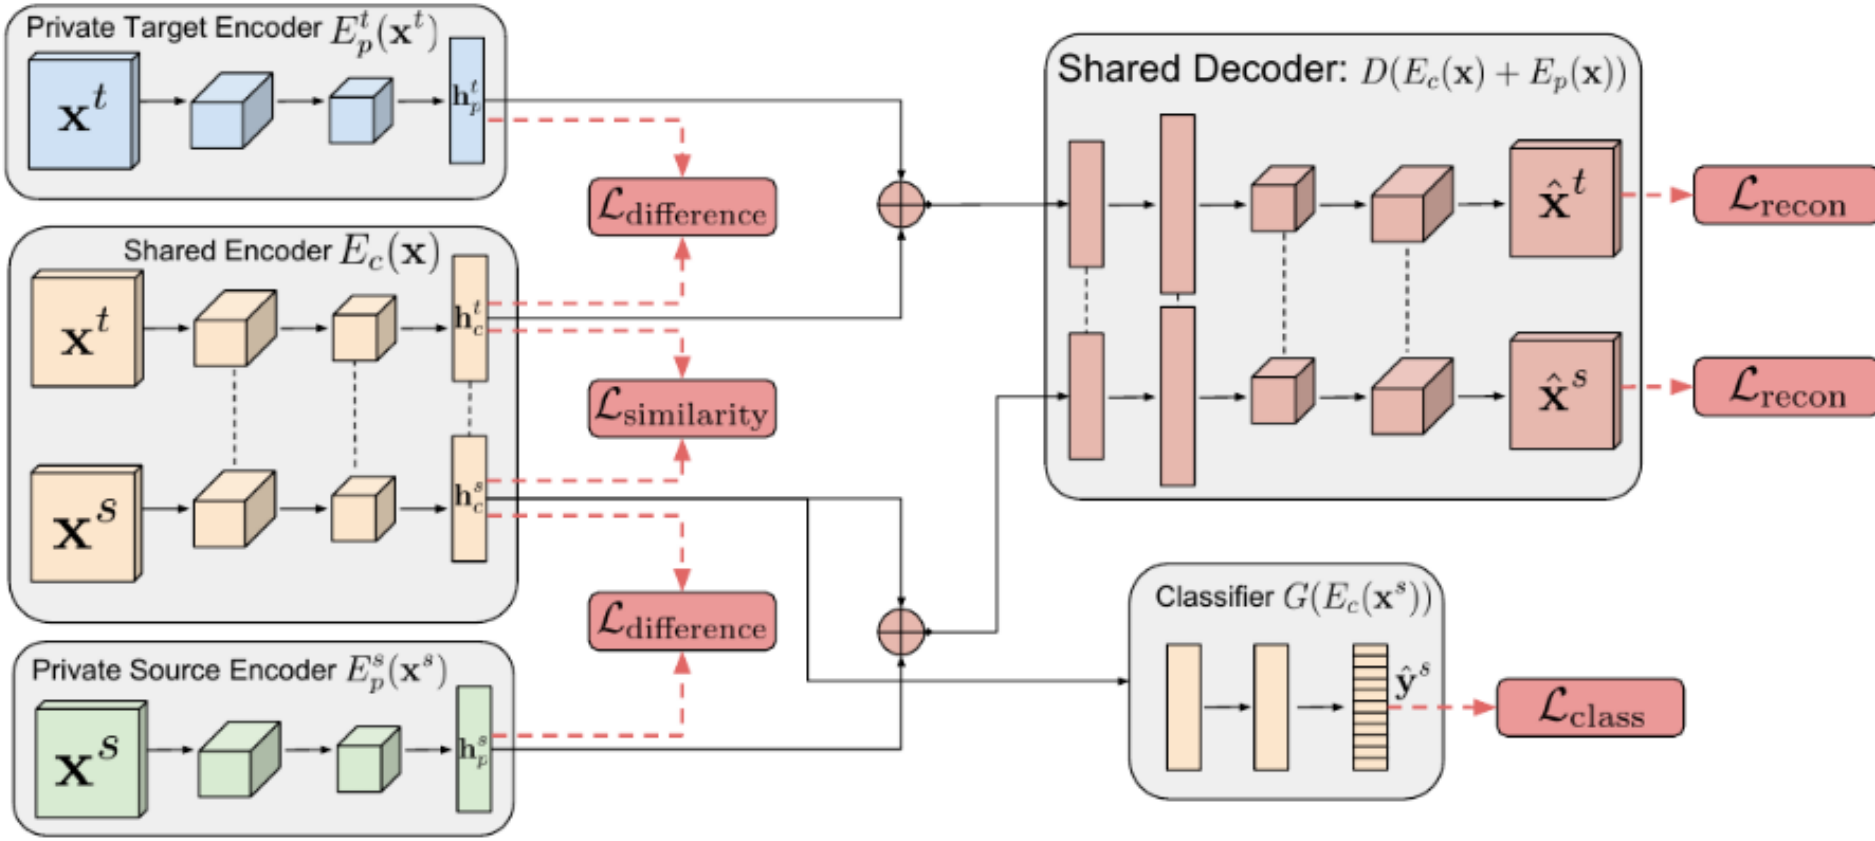
Another example: Adversarial Discriminative Domain Adaptation [Tzeng et al. 2017]



Domain adaptation

skip

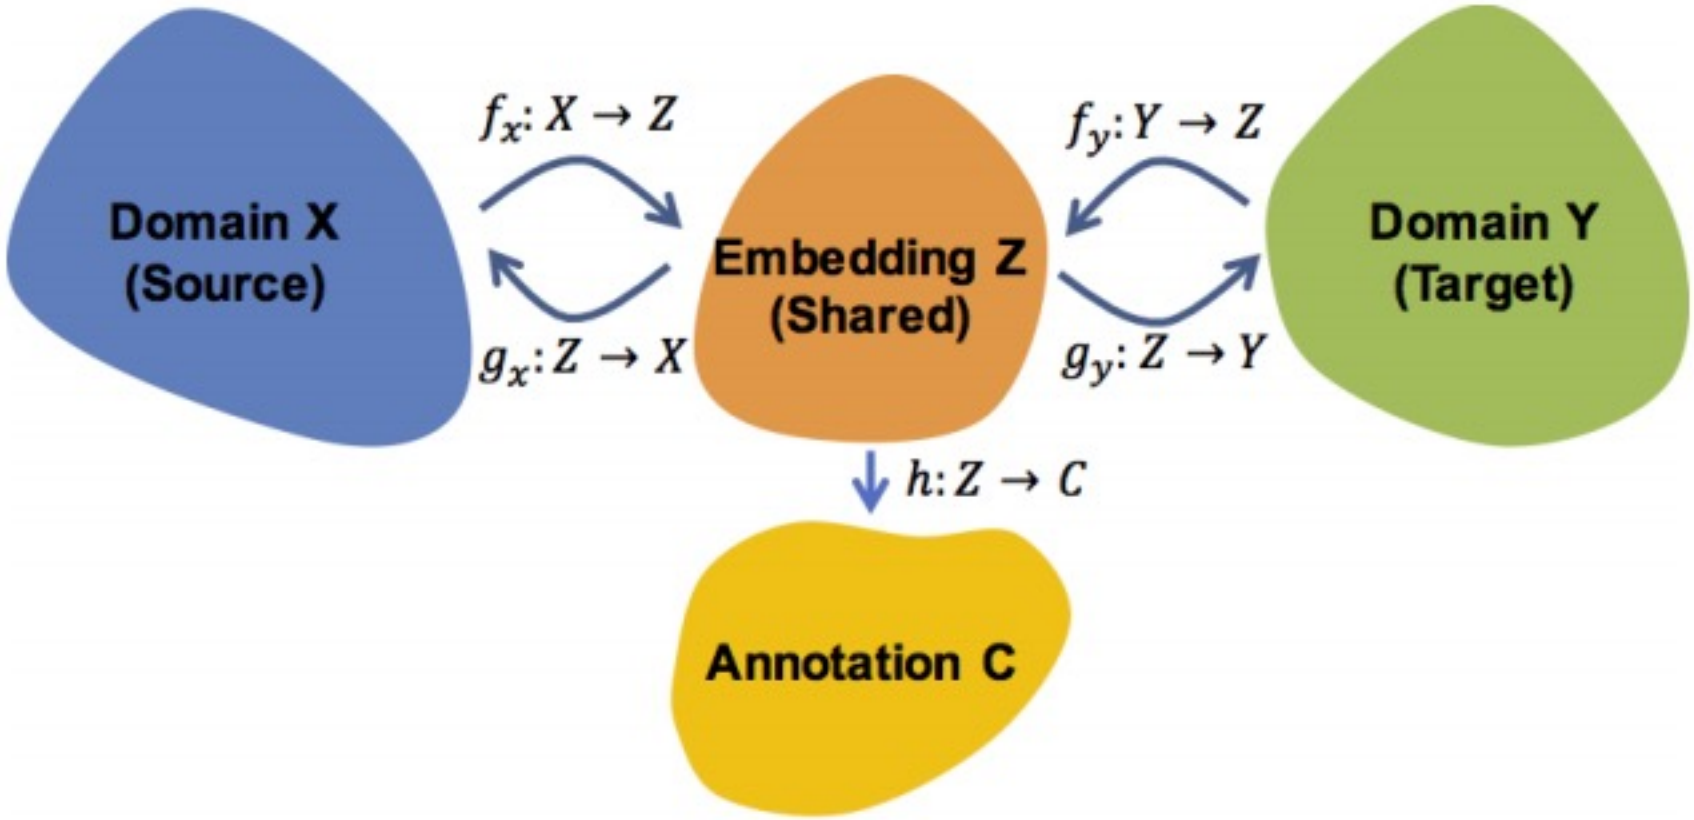
Other architecture



Domain adaptation

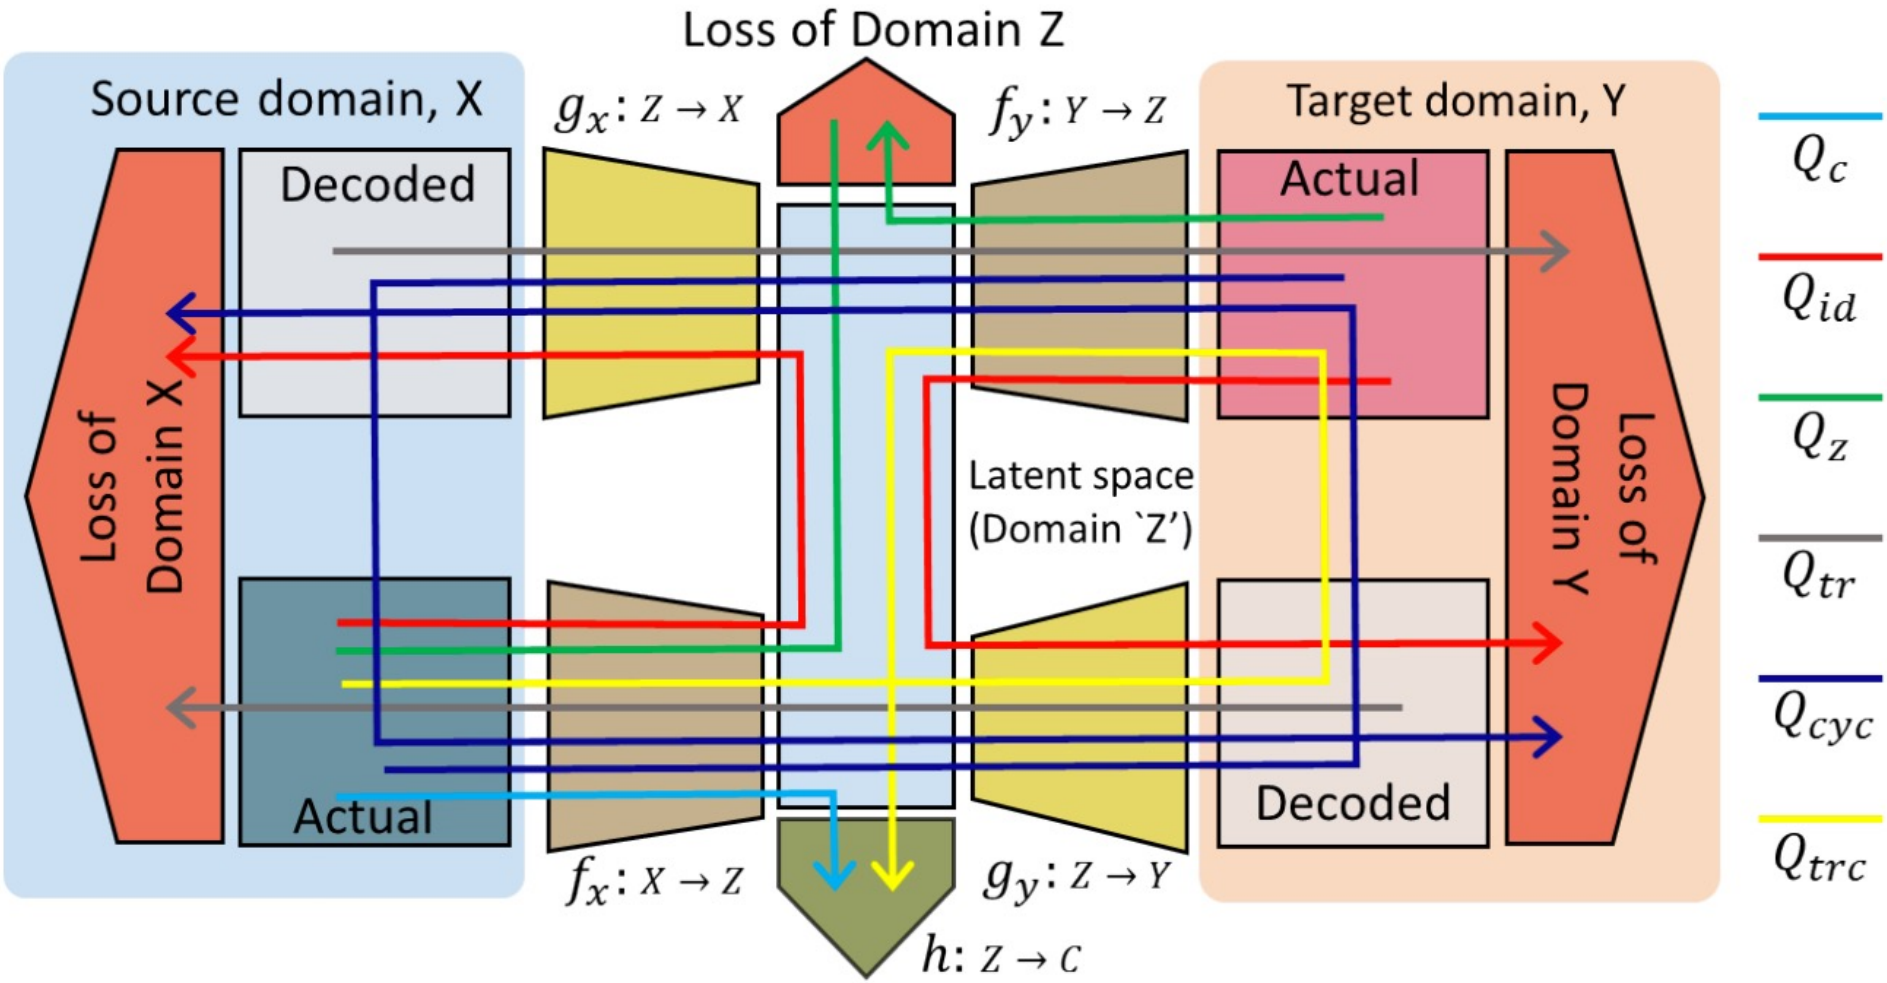
simple design
2 domains, 1 embedding

Other architecture: Image translation for Domain adaptation [Murez 2017]



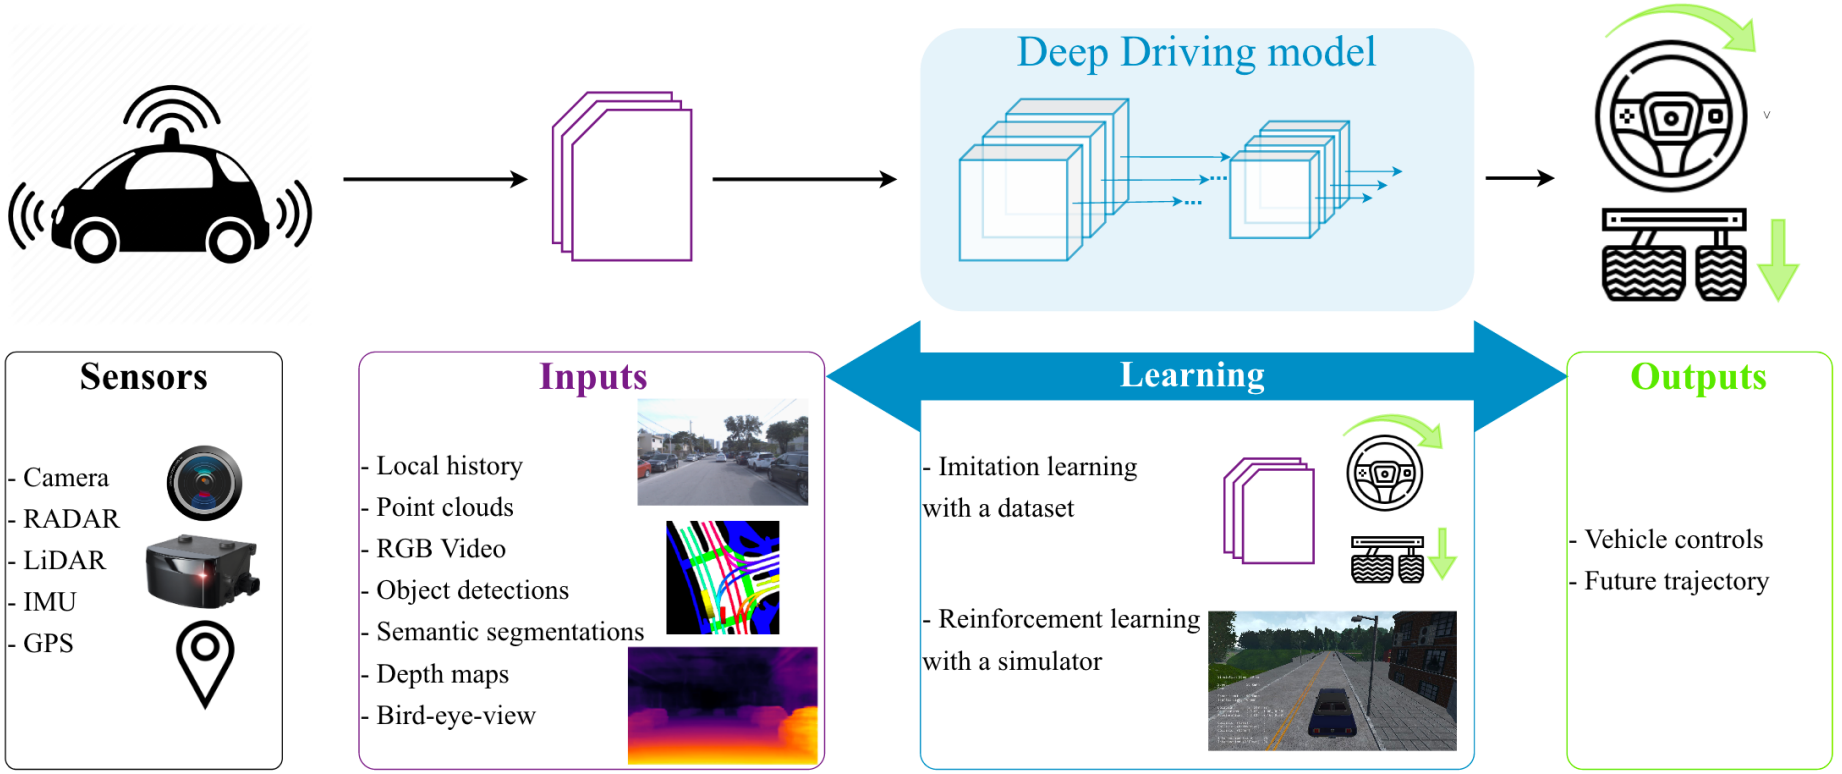
Domain adaptation

Other architecture: Image translation for Domain adaptation [Murez 2017]



Use-Case: Domain adaptation for Autonomous driving

Context: Neural network-based autonomous driving system framework



Challenges for perception

Multi-sensor perception

- Sensor fusion; Camera, radar and Lidar

3D dynamic understanding

- 3D object detection; Motion forecast; Intention prediction

Frugal learning

- Training with limited data or supervision; Domain adaptation

Reliability

- Robustness; Uncertainty estimation; Failure prediction

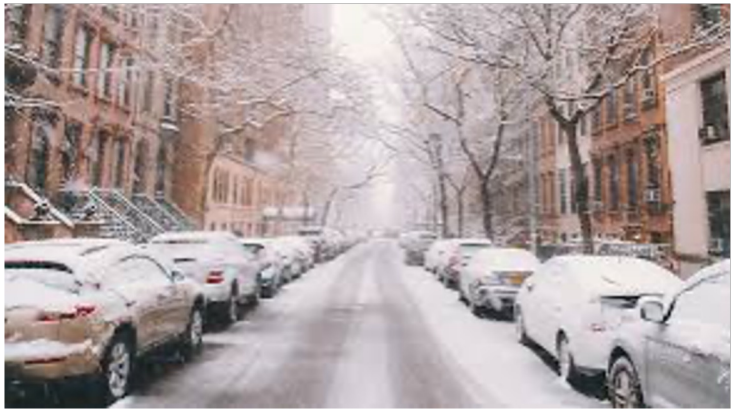
Explainability

- Decision interpretation; Post-hoc or by-design

Domain gap

Different, though *related* input data distributions

Source domain → Target domain



huge number of examples like this → large gap

- Different weather, light, location, sensor's spec/setup

Domain gap

Different, though *related* input data distributions

Source domain → Target domain

- Different weather, light, location, sensor's spec/setup

Domain gap

Different, though *related* input data distributions

Source domain → Target domain

- Different weather, light, location, sensor's spec/setup

Domain gap

Different, though *related* input data distributions

Source domain → Target domain

- Different weather, light, location, sensor's spec/setup

Domain gap

Different, though *related* input data distributions

Source domain → Target domain

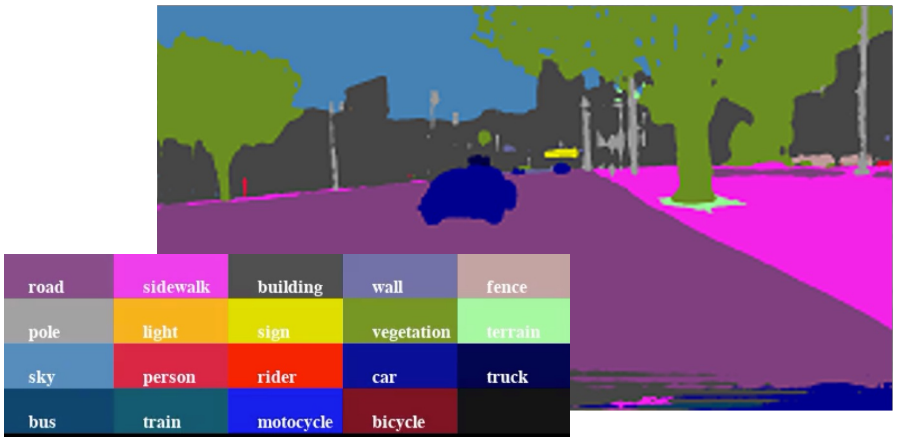
train on a simulator → infer in real world

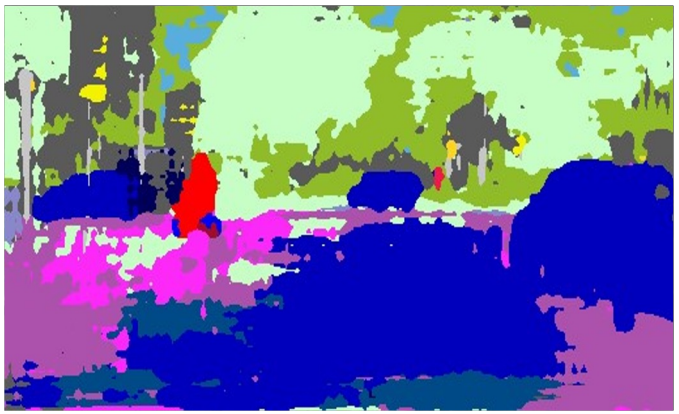
- Synthetic vs. real

Domain gap

Different, though *related* input data distributions

Source domain → Target domain





- Synthetic vs. real

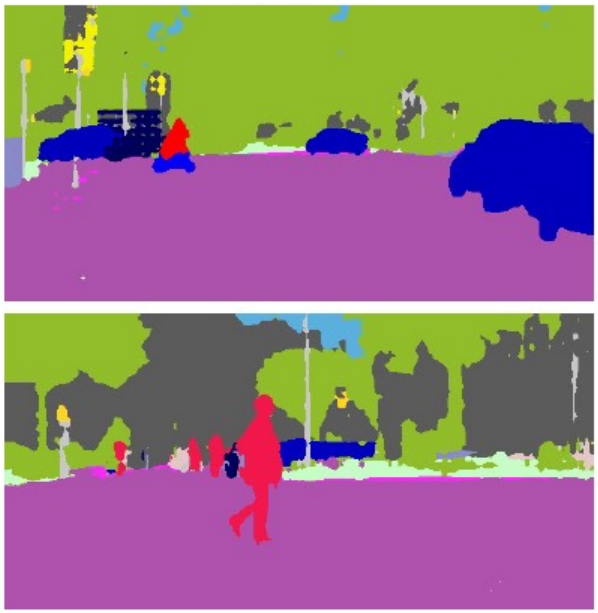
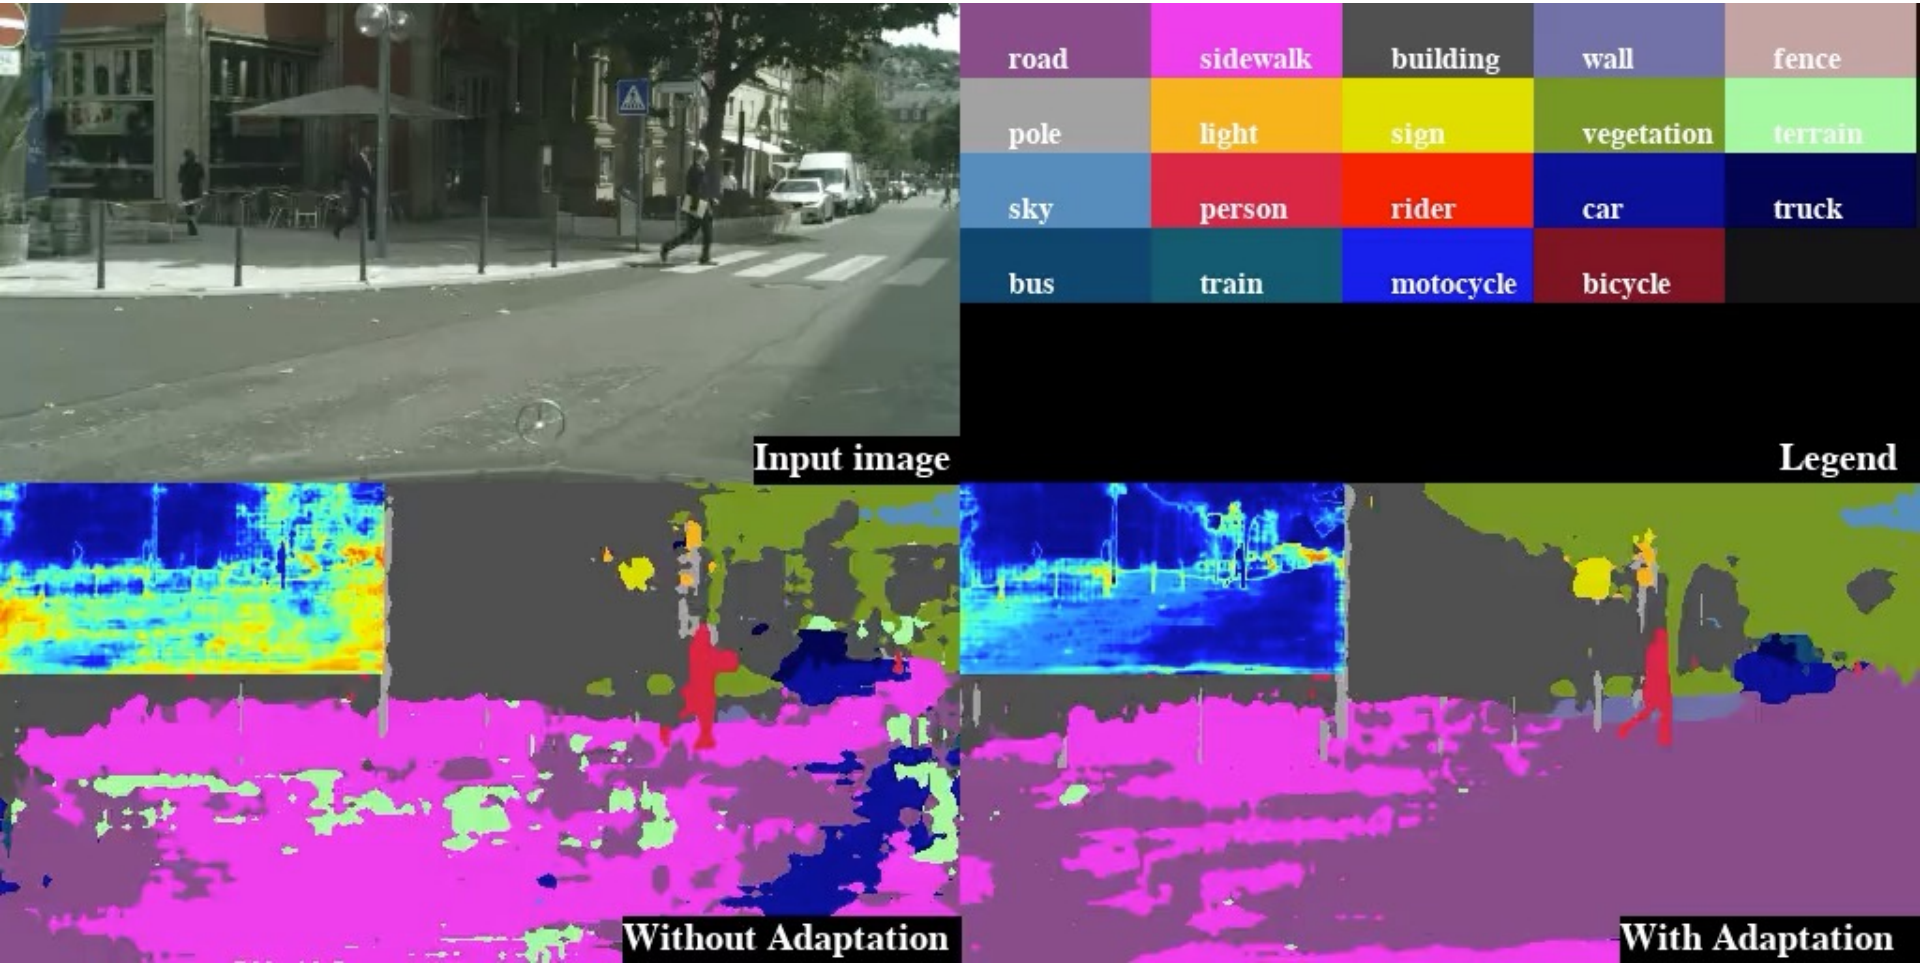
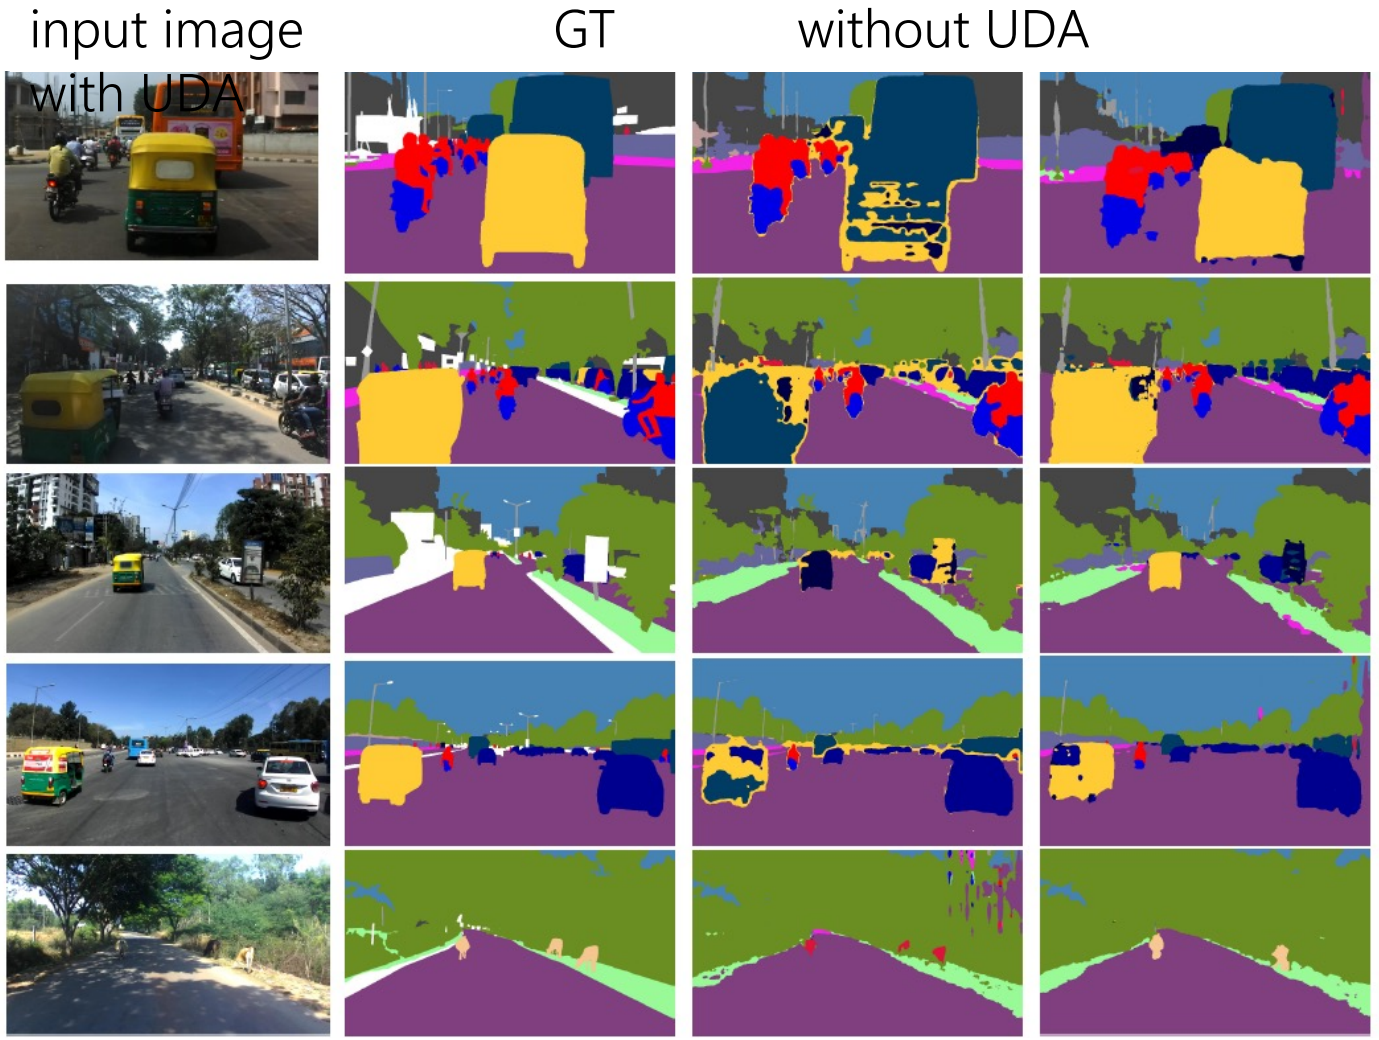
with UDA



UDA Results (with Adversarial Entropy)

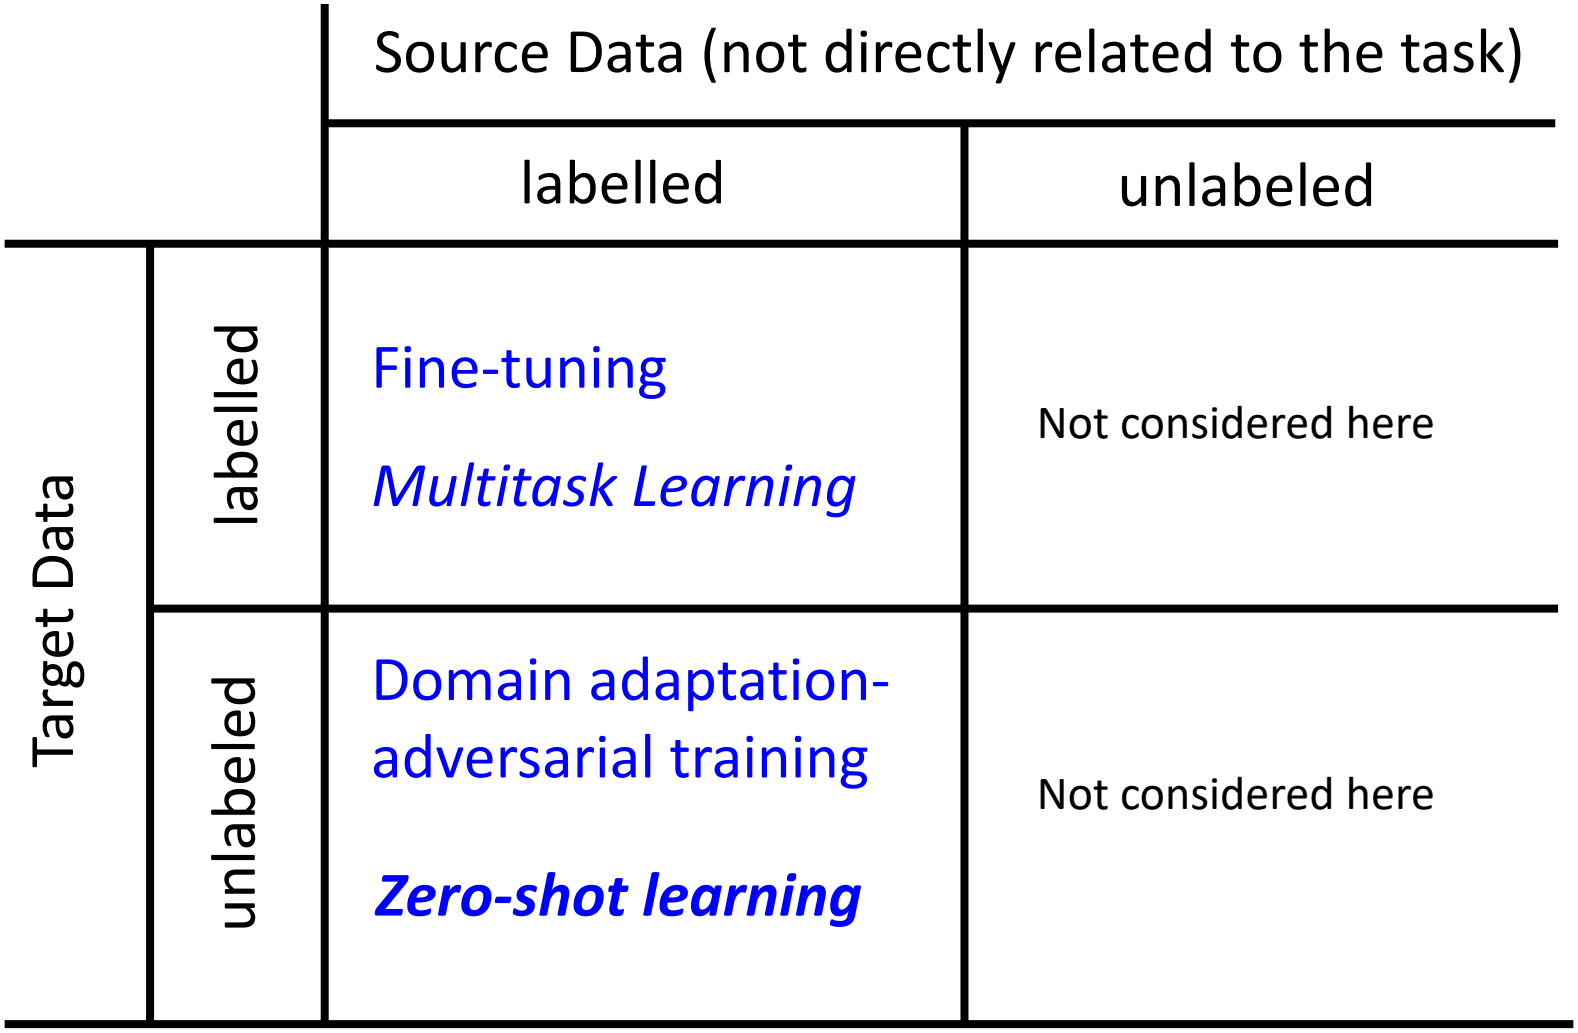


Extension: Zero shot + Domain adaptation



Private target classes: tuk-tuk, animal. Some shared classes: truck, road, side walk, car, person, motorbike, tree, building.

Transfer Learning - Overview



Zero-shot Learning

SAME DOMAIN, DIFF TASKS

- Source data: (x^s, y^s) → Training data
- Target data: $(\emptyset)$ usually same domain

Different tasks

$Training\ time$: x^s:   ...

y^s: cat dog ...

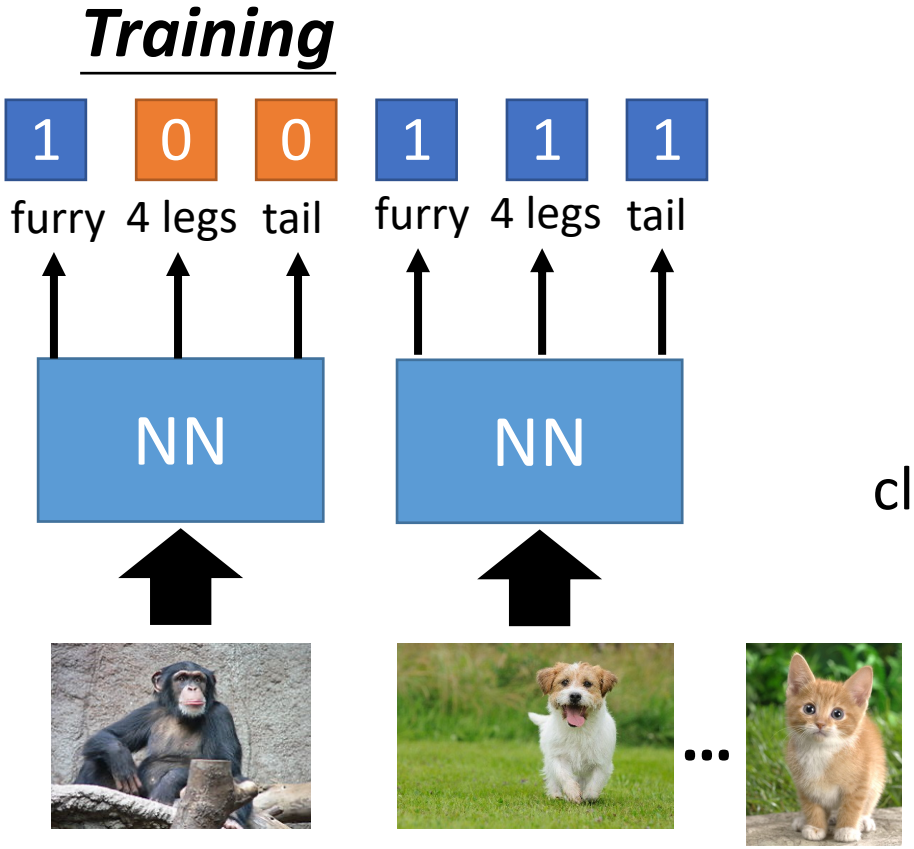
+ Class Information

$Test\ time\ x^t$: 

=> Fish class!

Zero-shot Learning

- Representing each class by its attributes



+
Database attributes

class

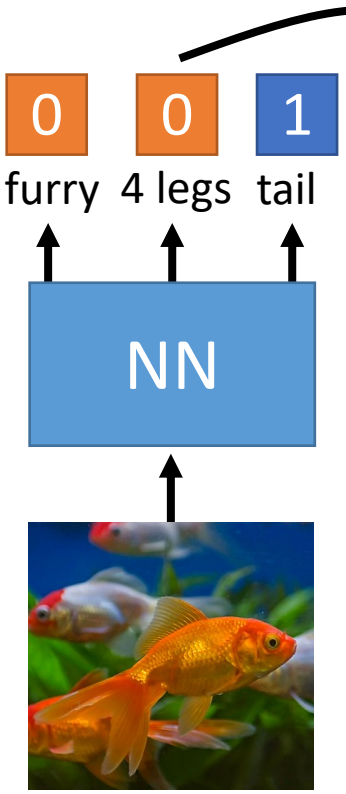
	furry	4 legs	tail	…
Dog	O	O	O	
Fish	X	X	O	
Chimp	O	X	X	
…				

sufficient attributes for one to one mapping

Zero-shot Learning

- Representing each class by its attributes

Testing



Find the class with the most similar attributes

class

attributes

	furry	4 legs	tail	…
Dog	O	O	O	
Fish	X	X	O	
Chimp	O	X	X	
…				

sufficient attributes for one to one mapping

zero examples of my target (fish)

Zero-shot Learning

What if we don't have attribute database

- Attribute embedding + class (word name) embedding

Zero-shot Learning

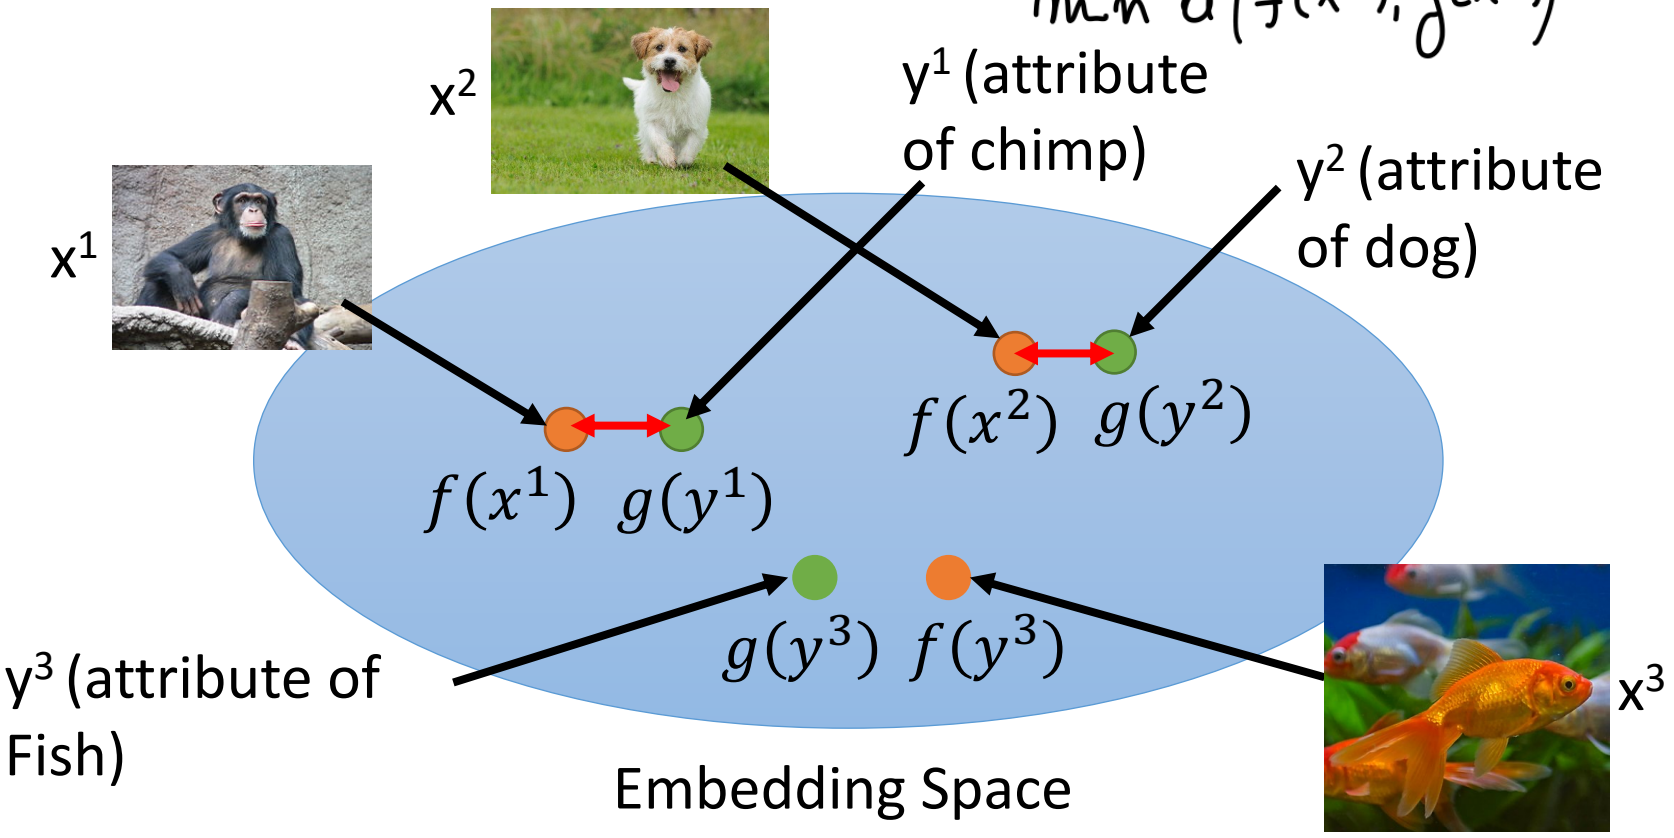
$f(*)$ and $g(*)$ can be NN.

Training target:

$f(x^n)$ and $g(y^n)$ as close as possible

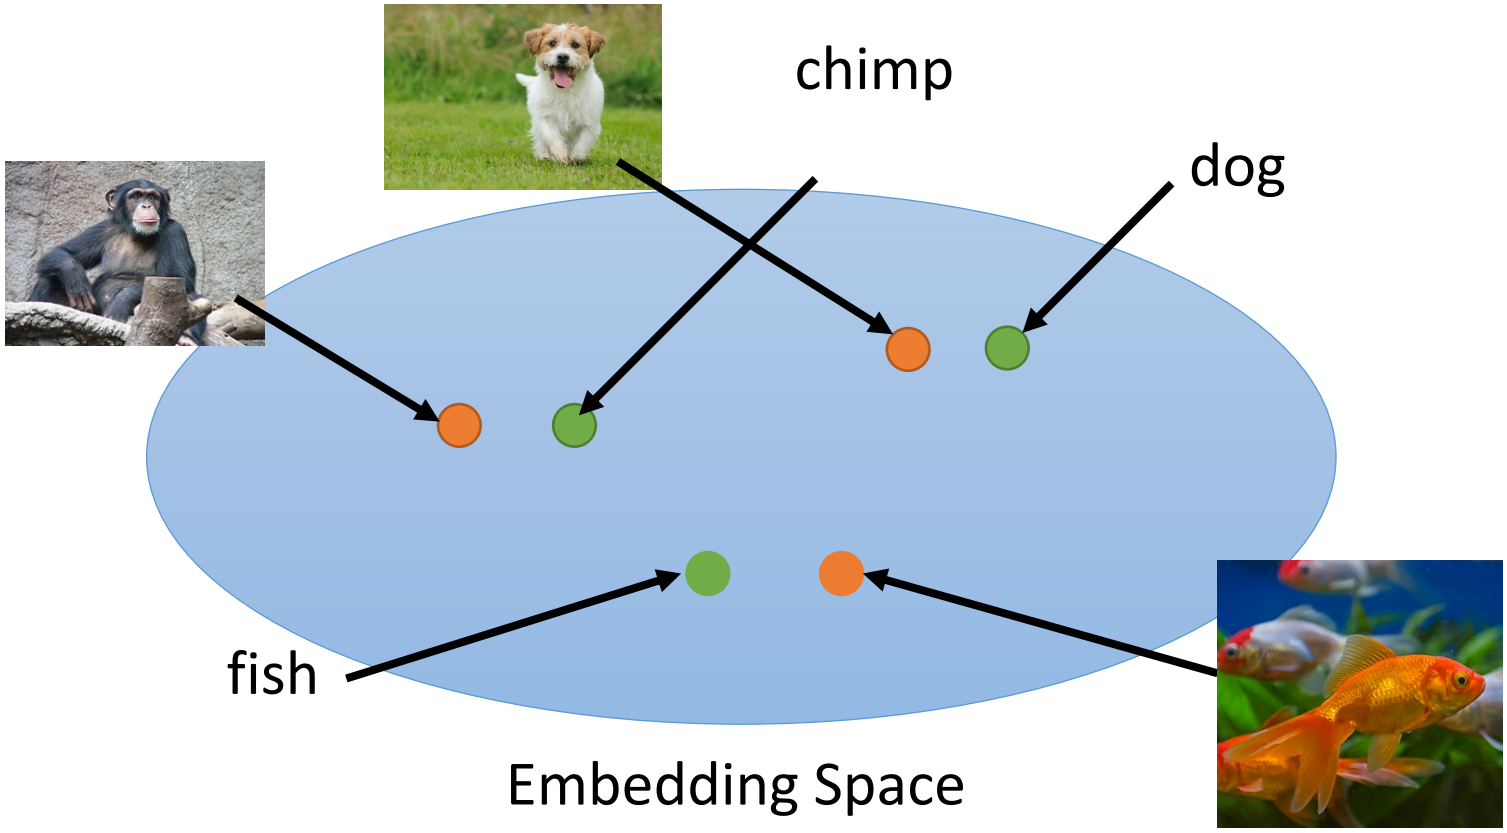
$$\min d\left(f(x^n), g(x^n)\right)$$

- Attribute embedding



y^i are linked together by a class relationship (e.g. class name embedding as W2v)

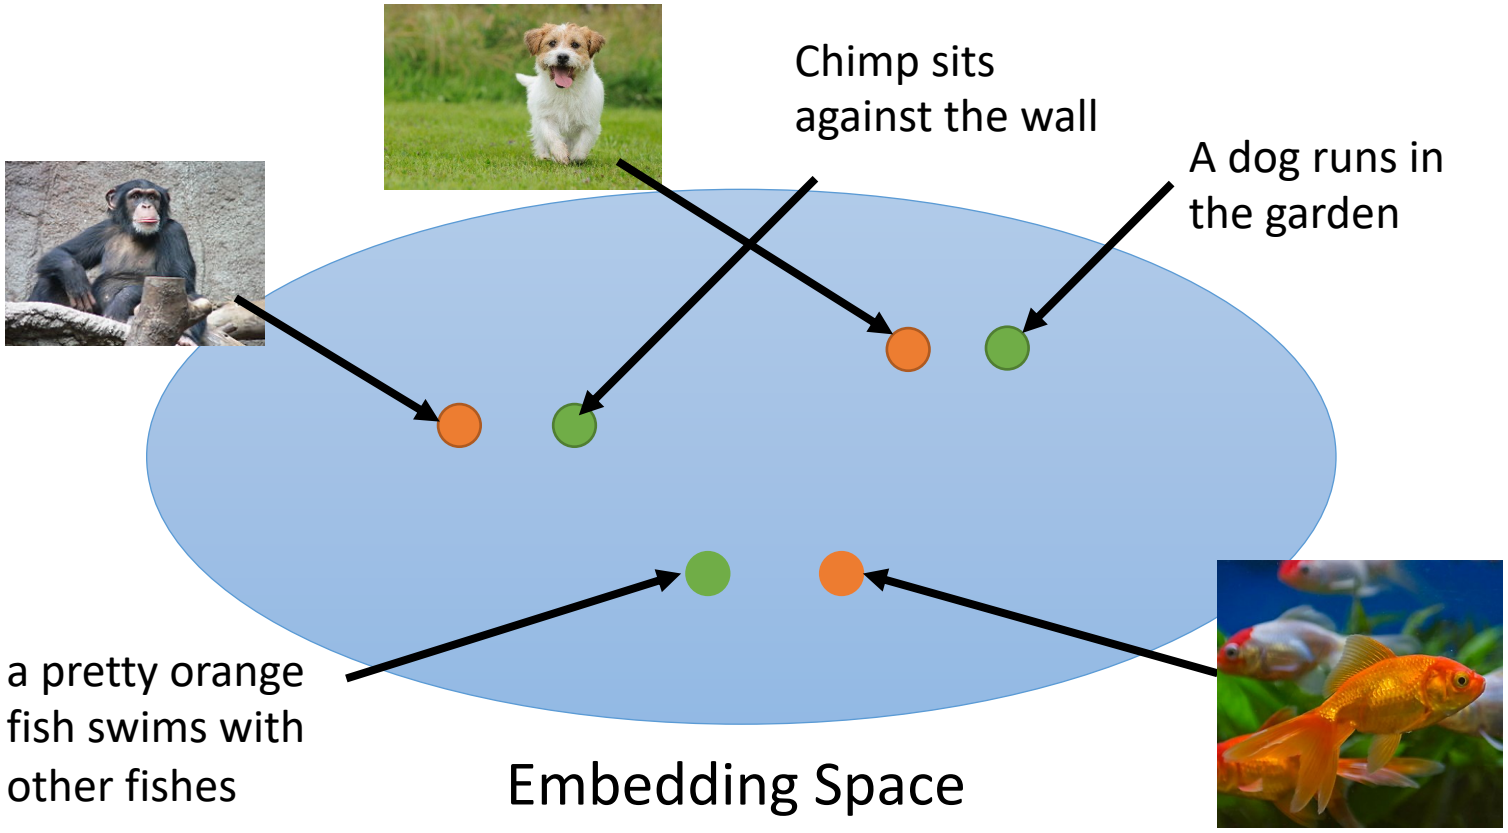
More on Vision-Language



First time ever alignment in a latent space between imgs and classes

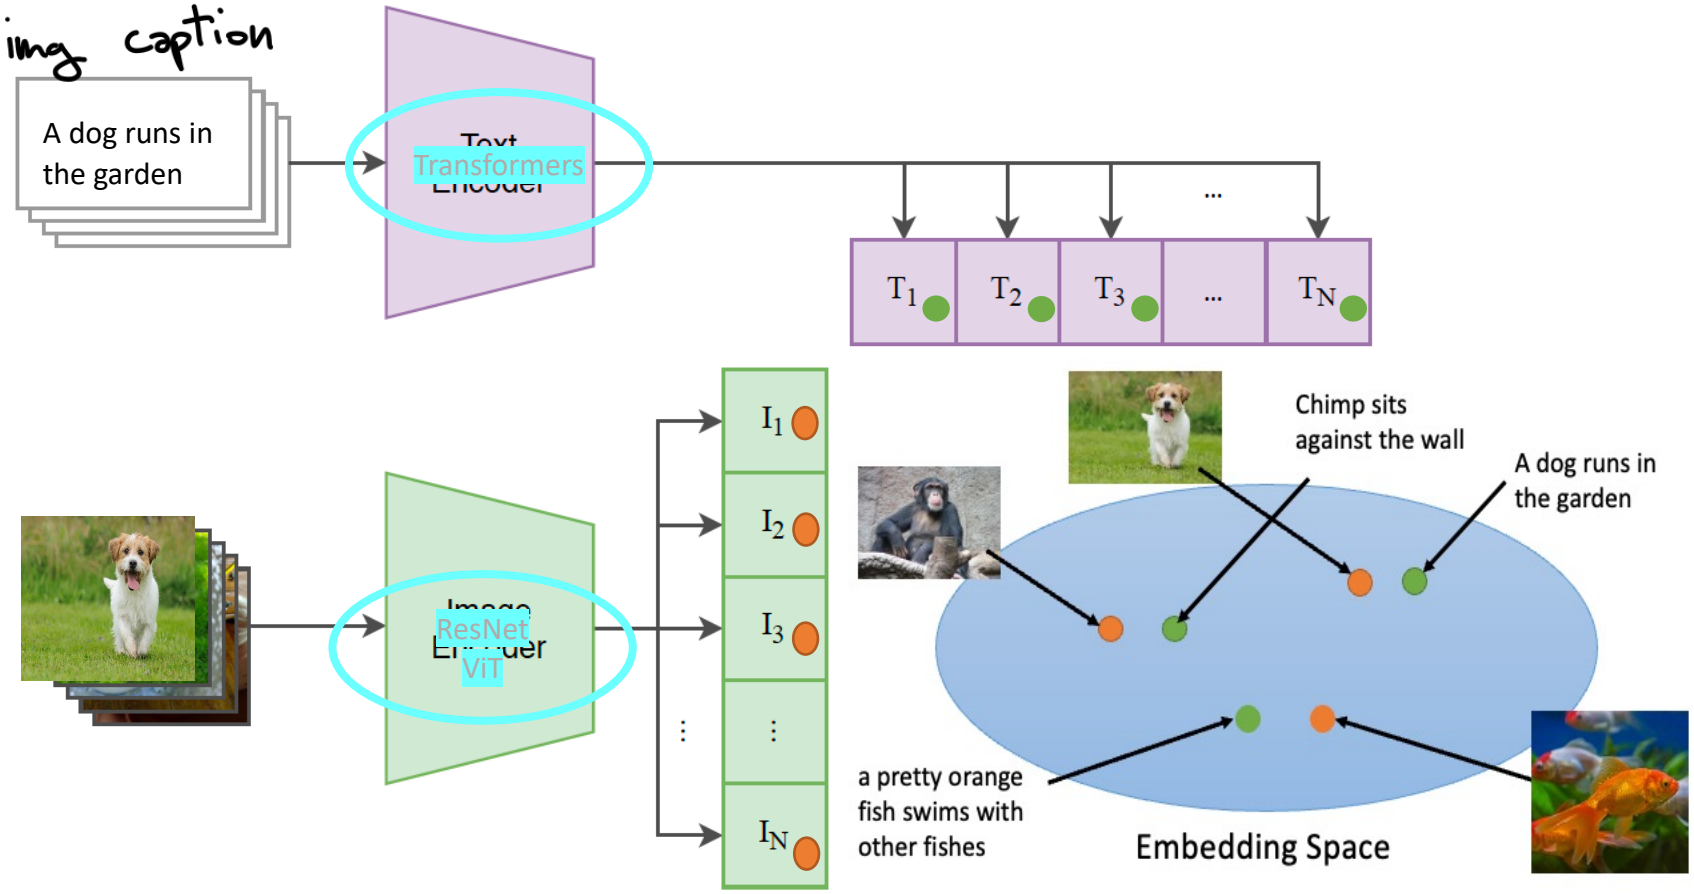
CLIP: Vision + Language Models (VLM)

[Learning transferable visual models from natural language supervision. Radford/Sutskever ICML, 2021]



CLIP: Vision + Language Models (VLM)

Dual architecture: Text encoder + Image encoder



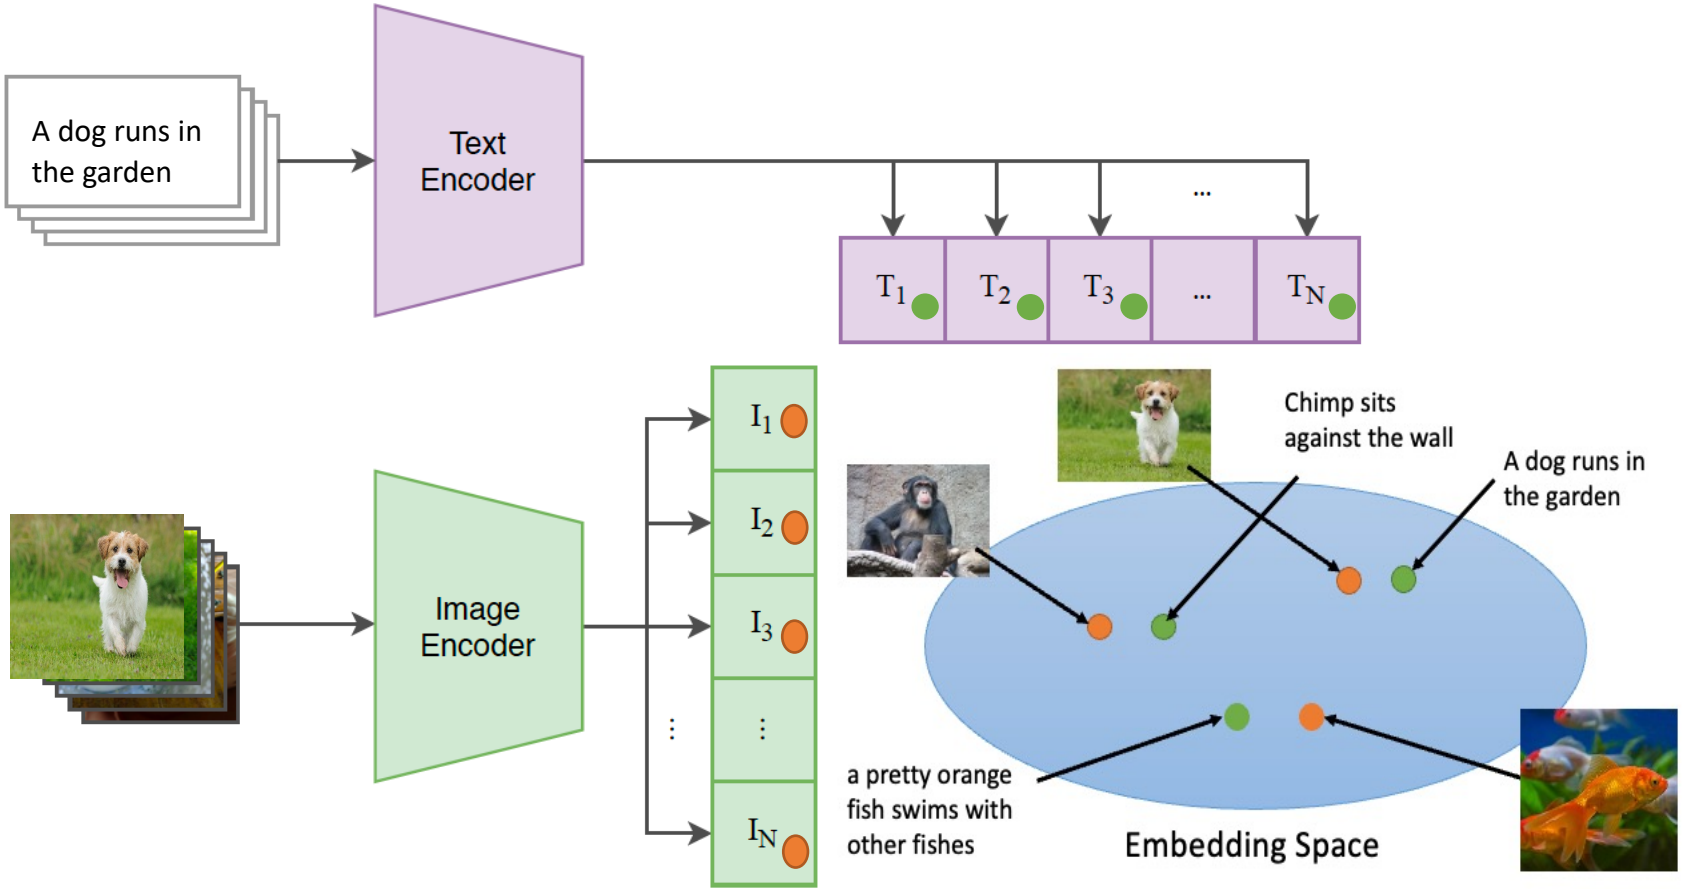
CLIP: Vision + Language Models (VLM)

Learning strategy

Training set: $A = \{(\mathbf{I}_n, \mathbf{T}_n)\}_n$ of image/caption pairs (coherent!)

Massive Text+Image =**400M pairs** to train the model (from the Internet)

Contrastive loss for training: positive pair vs negative one or set



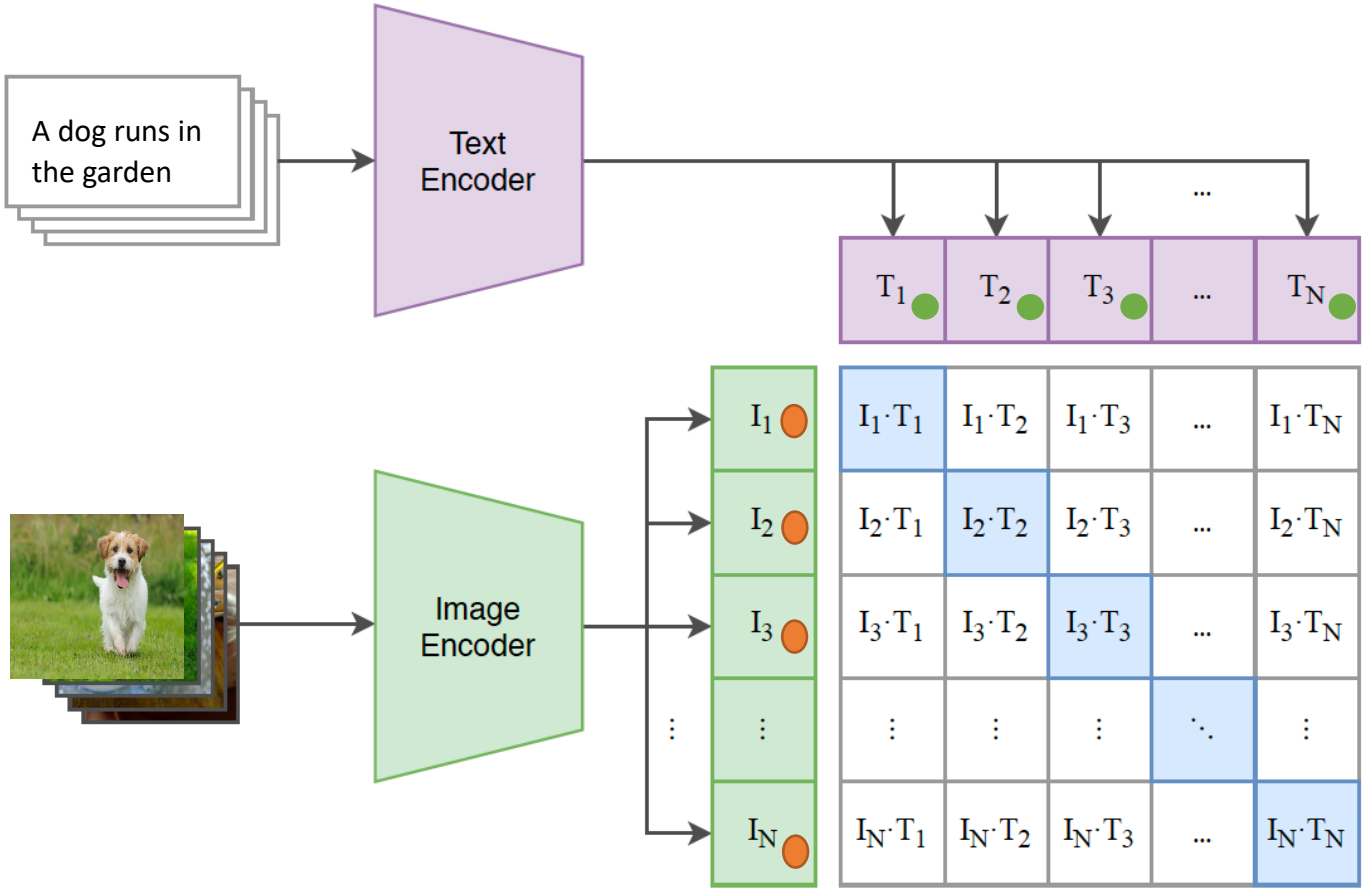
CLIP: Vision + Language Models (VLM)

Learning strategy

Training set: $A = \{(\mathbf{I}_n, \mathbf{T}_n)\}_n$ of image/caption pairs (coherent!)

Massive Text+Image =**400M pairs** to train the model (from the Internet)

Contrastive loss for training: positive pair vs negative one or set



CLIP: Vision + Language Models (VLM)

Learning strategy

Training set: $A = \{(\mathbf{I}_n, \mathbf{T}_n)\}_n$ of image/caption pairs (coherent!)

Massive Text+Image =**400M pairs** to train the model (from the Internet)

Contrastive loss for training: positive pair vs negative pair or more

(contrastive) Triplet loss: A variant of the standard margin based loss (SVM)

- Triplet $(\mathbf{y}, \mathbf{z}, \mathbf{z}')$
- Anchor: $\mathbf{y}$ (E.g image representation)
- Positive: $\mathbf{z}$ (E.g associated caption representation)
- Negative: $\mathbf{z}'$ (E.g contrastive caption representation) push them far away
- Margin parameter α

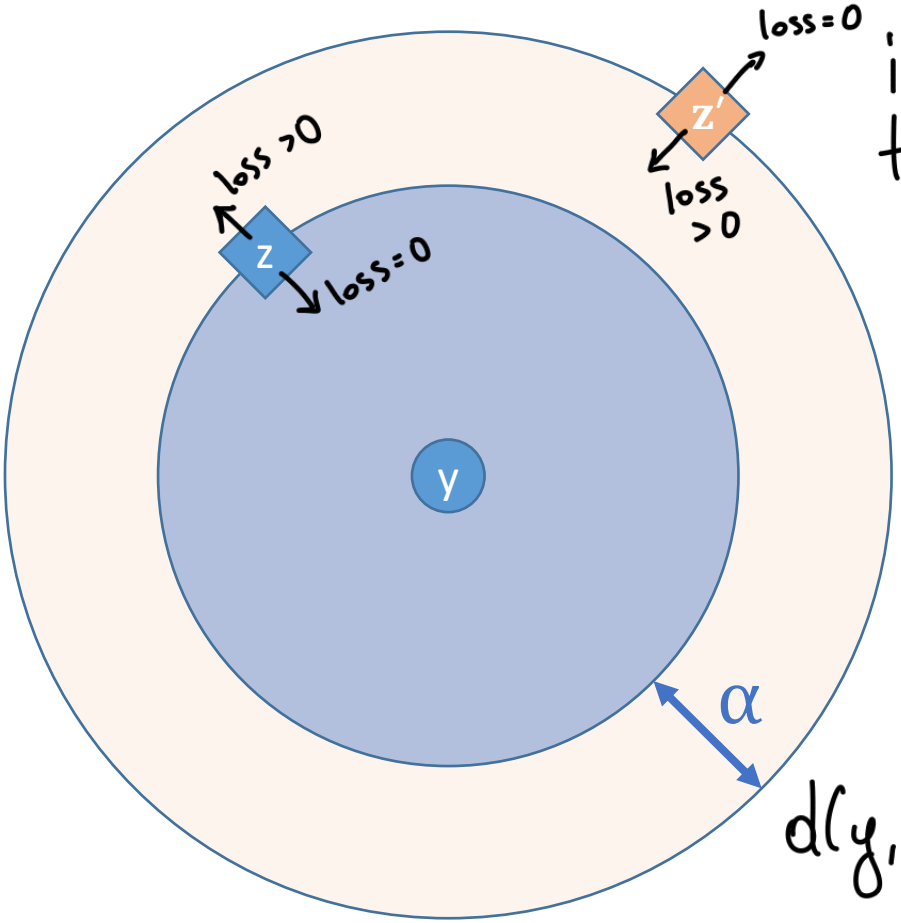
push them close

$$\text{loss}(\mathbf{y}, \mathbf{z}, \mathbf{z}') = \max\{0, \alpha - < \mathbf{y}, \mathbf{z} > + < \mathbf{y}, \mathbf{z}' >\}$$

CONTRASTIVE APPROACH

Learning strategy: triplet loss

$$\text{loss}(\mathbf{y}, \mathbf{z}, \mathbf{z}') = \max\{0, \alpha + \underset{I\ T}{\mathrm{d}(\mathbf{y}, \mathbf{z})} - \underset{I\ T'}{\mathrm{d}(\mathbf{y}, \mathbf{z}')}\}$$



in this scenario the positive example z is closer to y than z' of a certain distance α:

loss = 0

$$\Updownarrow$$

$$d(y,z) + \alpha = d(y,z')$$

Learning strategy: triplet loss

Hard negative margin-based loss:

Loss for a **batch** $\mathcal{B} = \{(\mathbf{I}_n, \mathbf{T}_n)\}_{n \in B}$ of image/sentence pairs:

$$\mathcal{L}(\mathbf{\Theta}; \mathcal{B}) = \frac{1}{|B|} \sum_{n \in B} \left(\begin{array}{c} \max_{m \in C_n \cap B} \text{loss}\,(\mathbf{x}_n, \mathbf{v}_n, \mathbf{v}_m) \\ + \max_{m \in D_n \cap B} \text{loss}\,(\mathbf{v}_n, \mathbf{x}_n, \mathbf{x}_m) \end{array} \right)$$

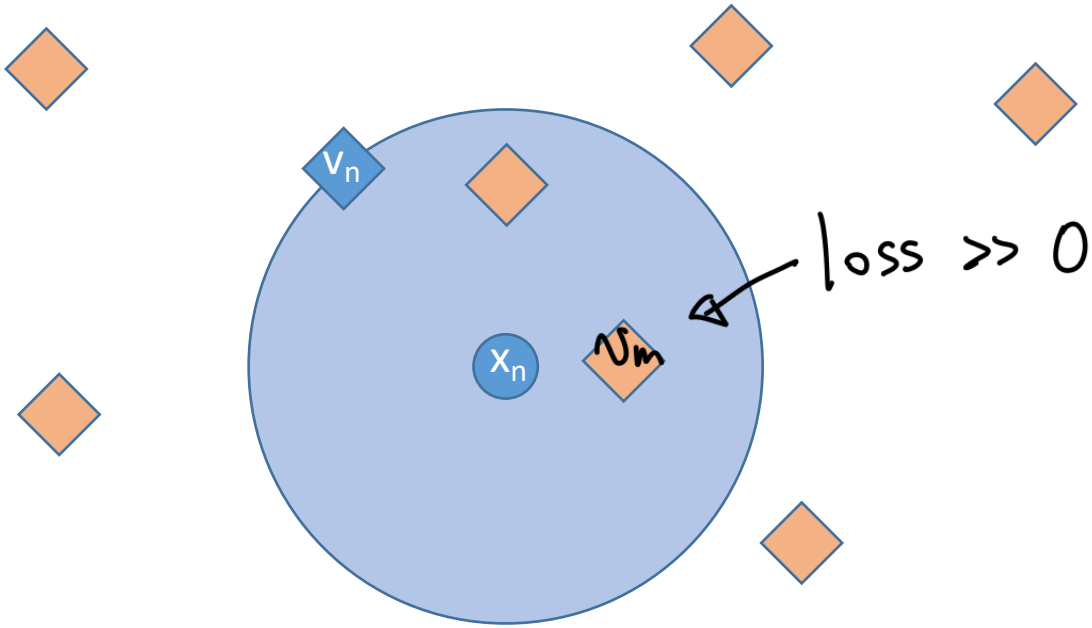
With C_n (resp. D_n) set of indices of caption (resp. image) unrelated to n-th element

Learning strategy: hard negative triplet loss

Mining hard negative contrastive example:

Select the most critical v_m that max loss

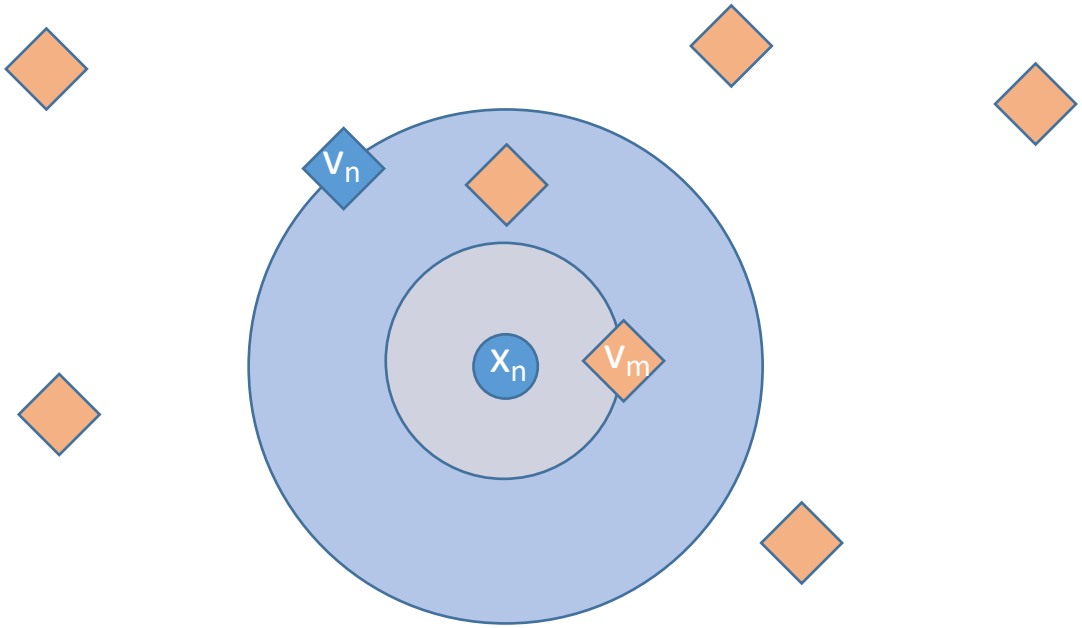
$$\mathcal{L}(\mathbf{\Theta}; \mathcal{B}) = \frac{1}{|B|} \sum_{n \in B} \left(\max_{m \in C_n \cap B} \text{loss}\left(\mathbf{x}_n, \mathbf{v}_n, \mathbf{v}_m\right) + \max_{m \in D_n \cap B} \text{loss}\left(\mathbf{v}_n, \mathbf{x}_n, \mathbf{x}_m\right) \right)$$



Learning strategy: hard negative triplet loss

Mining hard negative contrastive example:

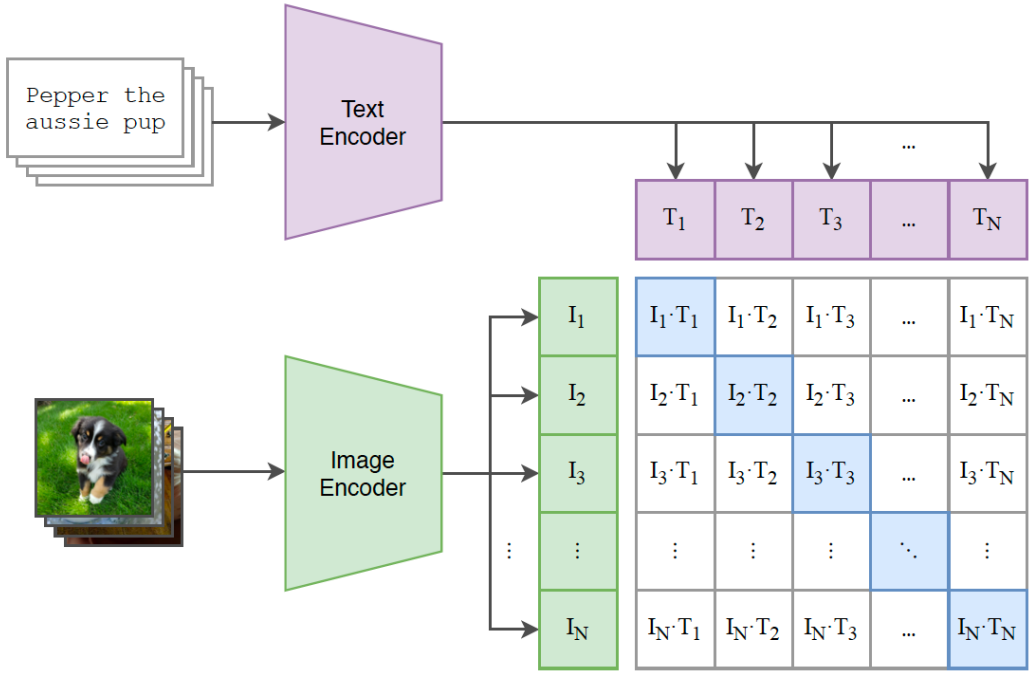
$$\mathcal{L}(\mathbf{\Theta}; \mathcal{B}) = \frac{1}{|B|} \sum_{n \in B} \left(\begin{array}{c} \max\limits_{m \in C_n \cap B} \text{loss}\,(\mathbf{x}_n, \mathbf{v}_n, \mathbf{v}_m) \\ + \max\limits_{m \in D_n \cap B} \text{loss}\,(\mathbf{v}_n, \mathbf{x}_n, \mathbf{x}_m) \end{array} \right)$$



CLIP: Vision + Language Models (VLM)

Massive Text+Image =**400M pairs** to train the model (from the Internet)

Contrastive loss for training



dot product = $I_i \cdot T_i$

$$\mathcal{L}_{InfoNCE_{CLIP}} = -\sum_i \log \left(\frac{\exp\left(\frac{sim(I_i, T_i)}{\tau}\right)}{\sum_{k=1}^{N} \exp\left(\frac{sim(I_i, T_k)}{\tau}\right)} \right)$$

compared with every other example in the batch

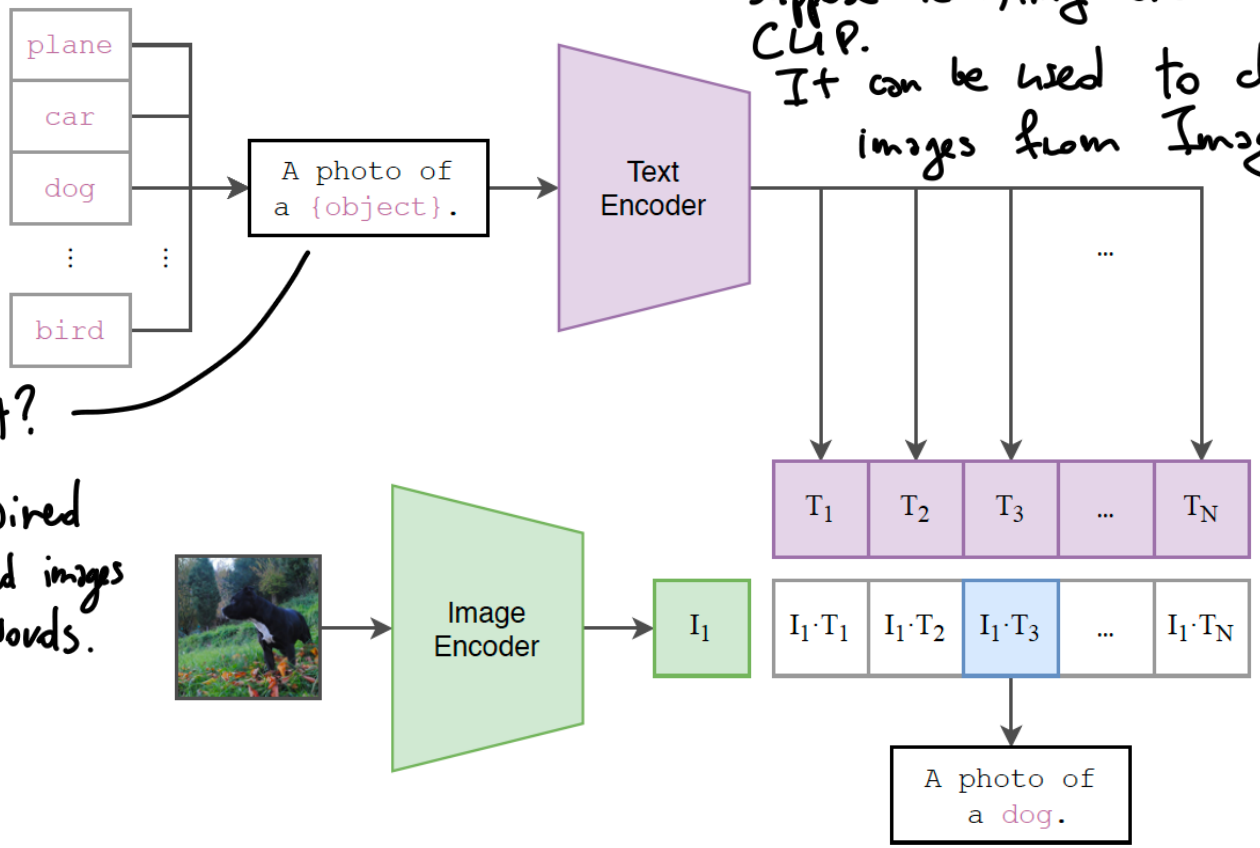
CLIP: Vision + Language Models (VLM)

write a sentence → embed → find closest image (RETRIEVAL)

Pre-trained encoders = **dual encoders** (Text/Image)

used for Zero-shot classifier, and other downstream tasks

Suppose text, img encoders trained by CLIP.
It can be used to classify images from ImageNet



why the prompt?
Because it was trained with more detailed images and not single words.

A lot of variants ….
